

International Civil Aviation Organization

**The Nineteenth Meeting of the Regional Airspace Safety Monitoring
Advisory Group (RASMAG/20)**

Bangkok, Thailand, 26-29 May 2015

Agenda Item 5: Airspace Safety Monitoring Activities/Requirements in Asia/Pacific Region

AAMA LTHM BURDEN ESTIMATE UPDATE

(Presented by Australia)

SUMMARY

This paper presents the current monitoring burden for aircraft registered and operated by Australia, Indonesia, the Solomon Islands and Papua New Guinea to meet Annex 6 requirements.

1. Introduction

1.1. The Long Term Height Monitoring Impact Statement developed by RASMAG was endorsed by APANPIRG/20 in September 2009. That statement included a determination by each of the Asia/Pacific Regional Monitoring Agencies (RMAs) of the anticipated monitoring burden for each State within the region. RASMAG/12 tasked the RMAs to review and update that data and subsequent meetings have seen RMAs report accordingly. The Australian Airspace Monitoring Agency (AAMA) last provided anticipated monitoring burden data at RASMAG/19. This current paper provides an update to that data.

2. Discussion

2.1 The AAMA has previously supplied data on its anticipated monitoring burden following the implementation of long term height monitoring in November 2010. The data was based on a review of the current RVSM approvals data for the State airspaces that the AAMA is responsible for, taking into account completed successful monitoring activity.

2.2 A review of the most recent RVSM approvals databases maintained by the AAMA on behalf of ICAO determined that the total number of RVSM approved aircraft totalled 1128 as at May 2015. This represents an increase of 100 aircraft since the last report at RASMAG/19 in May 2014.

2.3 Applying the minimum monitoring requirements (MMR) to the total of approved aircraft results in a total monitoring burden of 334 aircraft. Taking into account the aircraft already successfully monitored, the current outstanding burden is 113 aircraft an increase of 34 airframes from that reported to RASMAG in 2014. The existing burden comprises 37 Australian registered, 73 Indonesian registered and 1 Papua New Guinea registered aircraft. The AAMA expects that nearly all of the Australian registered aircraft will be monitored in the medium term as the ADSB mandate takes effect. Approximately 96% of all RVSM approved aircraft with Australian registration have been monitored using the ADS-B Height Monitoring System (AHMS).

2.4 In relation to the Australian data, nearly 100% of all aircraft in the fleets of QANTAS, Virgin Australia, Jetstar, Tiger, Alliance Airlines, National Jet, Network Aviation, Air North, and Nauru Air Corporation, have been successfully monitored. Of the total Australian registered RVSM approved fleet 32 airframes are considered overdue in terms of the minimum monitoring requirements (MMR). This means that either the aircraft have not been monitored at all since the introduction of long term height keeping monitoring in November 2010, or the operator has not met the 2 year requirement for subsequent monitoring. A review of the operators involved shows they have small fleets of business jets or are single aircraft private operators. Reasons for not having met the requirements range from currently not ADSB equipped, difficulties obtaining GMU monitoring, or simply unexplained non-compliance. The AAMA continues to follow up the status of these operators with the relevant State authorities.

2.5 The AAMA has also monitored a significant number of Royal Australian Air Force aircraft with the KC30, BE30, B737NX, C130J and CL60 fleets exceeding the MMR requirements. These aircraft were monitored with a mix of ADSB and GMU systems. Data for the C17 fleet has now been identified from NAARMO and European RMA and as a result the fleet now meets the monitoring requirements.

2.6 In relation to Indonesian registered RVSM approved aircraft, 49 aircraft remain overdue in terms of the MMR. Difficulties with accessing GMU monitoring in a timely way underlie the overdue status for these aircraft as a number are 'classics' that are not ADSB equipped or do not operate outside the Indonesian FIRs. The AAMA continues to try to source suitable ADS-B data from Indonesia so that more effective monitoring can take place.

2.7 Attachment A provides details of the monitoring burden based on the minimum monitoring requirements.

3. Actions by the Meeting

3.1 The meeting is invited to:

- a) review the information provided in the paper and **Attachment A**;
- b) use the information to update the current monitoring burden anticipated for the Asia/Pacific RMAs.

---END---
