

AN OPERATOR'S VIEWPOINT

Key Points

- → Re-certification is a current process
- → Re-certification may distort competition
- → Noise documentation is requested to be accurate
- → Accurate noise documentation requests flexibility

Main Principles

- → Re-certification:
 - >Equal treatment
 - >Minimum cost
- → Documentation:
 - >Low administrative burden
 - >Simplicity while accurate and flexible

A first experience of re-certification

- → In 1997, noise energy cap in CDG
- → In 1998, limitation of maximum flap deviation on AF Chapter 2 aircraft: 17 B737 200, 4 B747 100, in a subsonic fleet of 196. Frangible device
- → 737 200 certification measurement campaign in France: -3.2EPNdB instead of -4

Distortion of competition

- → 747 100: the last one retired in early 2000
 - Chapter 2 in the French register: prohibited at night and progressively banned at CDG after 1997. Non Stage 3 banned in USA in 1999
 - > Stage 3 with flap limited but non Chapter 3
- → Non Ch 3 AF 747 100 sold and operated as US registered aircraft without any restrictions as Ch 3 in CDG
- → Need for an international re-certification standard

Other Experiences

- → Progressive ban of "Ch 3 5" aircraft at CDG (cumulative margin < 5EPNdB)</p>
 - ➤ During night, after 2000: limitation of flap deviation of B747 200 freighter during 9 months
 - ➤ During the remainder of the day, after 2004: limited flap deviation and reduced mass after 2008
 - > Restriction slows fleet renewing if hush-kit amortization.
 AF intends not to hush-kit
- → Ch 3 to Ch 4 contemplated for 200 aircraft: no modification

Today's noise documentation

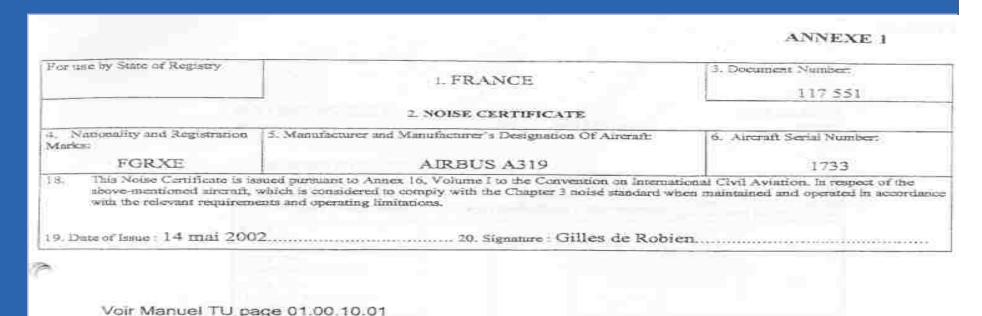

- → Some aircraft do not have to carry noise documentation. Complete noise documentation is in the AFM and AFM is not on board
- → Some on board documentation do not show certified levels
- → Some *type* noise certificate show the *maximum* MTOW for which the type complies (purchased MTOW): no updating
- → ICAO recommends to carry *individual* noise documentation

Individual noise documentation on board

- →Individual aircraft "changes" from time to time: at least, seasonal mass changes
- → Individual noise documentation need to be updated: administrative workload
- →ICAO provides 3 options

An example of option 3

- → The first document is an excerpt of the option 1 single document (numbered data)
- > It states the compliance of the individual aircraft

Second document: the AOM, A320 family example

- → The AOM is carried on board
- → On one page of the AOM: the configuration of each individual aircraft

Conclusion

- → Same data in the 3 options
- → Accurate levels of individual aircraft carried on board to be read by non expert:
 - Noise documentation in the AOM
 - ➤ Updating approval by the authority should bring minimal burden
