

CPDLC –

Cockpit  
perspective

# Objectives

- ▶ Describe crew procedures
- ▶ Discuss challenges/issues
- ▶ Answer questions

# Admin

- ▶ Delta centric
- ▶ Boeing 767 (old) architecture
- ▶ Western Africa anecdotes

I was just driving along minding my own business...

Photo: AFP

# TOPICS

- ▶ Cockpit Hardware
- ▶ CPDLC handling protocol
- ▶ Common messages/flow
- ▶ Crew feedback/issues

# The pilot as seen by himself –

- Calm, cool and collected
- Mission completion oriented
- lives and thinks at 600 mph
- thrives in a dynamic, ambiguous environment
- modest, humble

As seen by his wife –

Type-A,  
egocentric,  
needy,  
narcissistic,  
childish,  
control freak.

# As seen by management

# PILOT 101

- ▶ Process managers
- ▶ Automation dependency
- ▶ Failure modes
- ▶ complacency

SA

FLEXIBILITY

# Crew Knowledge of CPDLC/ADS-C

- ▶ Limited to operation - not design or differences – Boeing vs Airbus interface
- ▶ Theater exposure

# CRM

URE WARNING

## CO-PILOT CHECKLIST

1. DON'T TOUCH ANYTHING
2. KEEP YOUR MOUTH SHUT

# CPDLC PROTOCOL

- ▶ PM manages CPDLC dialogue
- ▶ PF manages FMS/MCP
- ▶ Both pilots verify all uplinks and downlinks
- ▶ Respond to messages within one minute

# Typical comm flow

- ▶ Logon
- ▶ CDA confirmation
- ▶ Climb request
- ▶ Weather deviation

# FANS

# LOGON CODES

ATSU Call Sign (Country)	FANS Logon	Remarks

# GENERAL ISSUES/ ANOMALIES

- ▶ Crew proficiency
- ▶ Logging on regardless of functionality-SatCom media limfac
- ▶ Free text instead of preformatted message sets
- ▶ Conditional clearances – crew change over
- ▶ Multi-element messages
- ▶ Lack of standardization
- ▶ Waypoint sequencing anomaly

# General Issues con't.

- ▶ Logon fail
- ▶ Transfer fail
- ▶ Multiple pages

# Standardization

## ATC & Flt Control Communication - ATC Communication

In summary, there are 3 different crew procedures worldwide for establishing CDA:

- Gander, Reykjavik, and Shanwick - ACCEPT/WILCO the automated message.
- The rest of the Atlantic - nothing.
- Pacific - SEND a CPDLC position report at the FIR boundary.

## Message Handling

### General

As described in the Vol. I, CPDLC communications should be handled by the pilot monitoring while the pilot flying should handle EMS changes. Crews should first

# CREW Challenges

- ▶ Keeping up with changes to GOLD
- ▶ Crew training-  
CBT/bulletins/manuals/OJT
- ▶ Standardization-crews are global
- ▶ Utilize full capabilities

I continue to get reports from Oakland and New York on B756 flight crews logging on CPDLC in VHF airspace in a/c that are not SATCOM equipped. As they journey further the ocean on the way to HNL, STT, SJU or any other island, ATC is faced with resolving minimum separation standards (based on FANS functionality) that are now compromised.

### Possible Solutions:

- Add a Flight Plan to remark to ALL B757s like
  - A/C IS NOT SATCOM EQUIPPED. DO NOT LOG ON CPDLC/ADS-C IF FLIGHT ENTER CLASS II AIRSPACE. USE HF FOR PSN RPTS / COMPANY COMMS WHEN OUT OF VHF COVERAGE. **PILOT DEVIATIONS MAY BE FILED**
- More Newsletter articles
- Fleet Bulletin
- EFOB

An even better solution is for Oakland and New York Oceanic to program their FDPS to accept a FANS logon from an a/c that has not filed J5 or J7. More to follow on that.

# Theater issues

- ▶ Abidjan and Luanda - voice comm challenges
- ▶ Auto transfer failure at FIR boundaries
- ▶ LPPO-GVSC-GOOO – transfer failure/voice request to connect
- ▶ Cayenne – CDA confirmation
- ▶ Uncertainty between procedural/surveillance airspace-xpdr vs posrep
- ▶ Variations in functionality between ATSU's
- ▶ Logon fail – Kano, Accra

# RECOMMENDATIONS

- ▶ Facilitate GOLD Standardization
  - CDA - welcome message vs position report vs Cayenne
  - Revised estimates
  - “CPDLC” suffix
- ▶ Increase utilization/functionality

ATL-JNB 01

\*\*PART 1 OF 2\*\* FLTS ENTERING SOOO FIR SHD SEND CPDLC LOGON  
NLT 30 MINS PRIOR TO FIR AND THEN SEND CPDLC PSN RPT  
CROSSING THE BOUNDARY TO CONFIRM CDA.

ATL-JNB 02

\*\*PART 2 OF 2\*\* REPLY WILL BE A - MONITOR - MESSAGE AND A  
EXPECT SELCAL CHECK ON /FREQ/.//

▶ PBT

What information does ADS-C provide to ATC?

*Click on the correct answer.*

A. Aircraft origin and destination

B. Precise radar return

C. Aircraft position and subsequent waypoints

D. Projected fuel burn

How does CPDLC benefit the crew and ATC?

*Click on the correct answer.*

A. It allows for fewer voice communication frequency changes.

B. It eliminates the need for company position reports.

C. It negates the requirement to monitor communications.

D. It reduces the need for VHF/HF voice communication.

# SUMMARY

- ▶ Great tool – Procedural airspace  
-Surveillance airspace enhancement
- ▶ Enhances SA, workload reduction
- ▶ Built in resilience – conformance monitoring, team of teams
- ▶ Future capabilities – DARP, in-trail procedures, RLatSM, RLongSM
- ▶ Evolving - Strengthen system, exercise

# CLOSING REMARKS
