#### **SAFETY FOCUS**

# Fatigue Risk Management in ANS

Human Performance Management WorkGroup (HPMWG)

**June 9th 2022 - Time** 

Courtney Jaeger NATS

Lea - Sophie Vink austro

# Aim of today / Agenda

- 1. Overview of FRMS guidance for ANSPs including critique and limitations of current ICAO standards for ANS (CANSO)
- 2. Comparison of ANSPs in Europe for the application of Rostering rules (Austro Control)
- 3. How fatigue is measured in ATC and amongst operational Engineers (NATS)
- 4. How fatigue is measured in ATC and the integrated FRMS at Austro Control (Austro Control)
- 5. CANSO HPM Team approach and on-going research: Fatigue meets Well-being (CANSO)
- 6. NATS Case study: Steering group, Operational Fatigue Policy and in-practice schedules

# **Definition of fatigue**

A physiological state of reduced mental or physical performance capability resulting from sleep loss, extended wakefulness, circadian phase, and/or workload (mental and/or physical activity) that can impair a person's alertness and ability to adequately perform safety related operational duties

EU 2017/373

ICAO 9966 - Annex D

# National Laws (including Occupational Health and

Safety)

#### ATS.OR.315 Fatigue

In accordance with point ATS.OR.200, an air traffic control service provider shall:

- (a) develop and maintain a policy for the management of air traffic controllers' fatigue;
- (b) provide air traffic controllers with information programmes on the prevention of fatigue, complementing human factors training provided in accordance with Sections 3 and 4 of Subpart D of Annex I to Regulation (EU) 2015/340.

#### ATS.OR.300 Scope

This section establishes the requirements to be met by the air traffic control service provider with regard to human performance in order to:

- (a) prevent and mitigate the risk that air traffic control service is provided by air traffic controllers with problematic use of psychoactive substances;
- (b) prevent and mitigate the negative effects of stress on air traffic controllers to ensure the safety of air traffic;
- (c) prevent and mitigate the negative effects of fatigue on air traffic controllers to ensure the safety of air traffic.

Local ANSPs

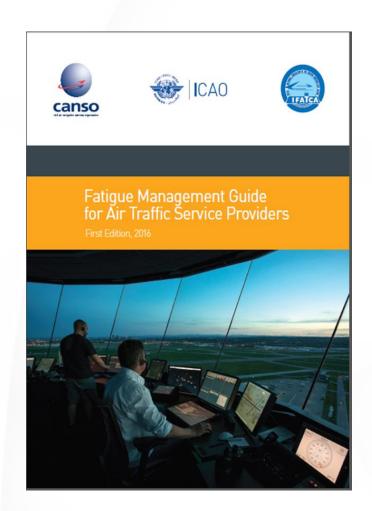

# Fatigue Risk Management Responsibilities

# Fatigue risk management has to be a shared responsibility between:

- The Regulator
- The Air Navigation Service Provider (or the airline)
- The Controller (or the pilot)

# **ANSP Responsibilities**

Implement work schedules that enable Air Traffic Controllers to perform their duties safely

Provide a working environment that has appropriate emphasis on controls and / or mitigations for fatigue-related risks

Provide adequate opportunities for rest and sleep

Provide fatigue management education and awareness training for all stakeholders

Have a process for monitoring and managing fatigue

#### ICAO

#### Doc 9966

# Manual for the Oversight of Fatigue Management Approaches Second Edition - 2016

#### Approved and published under the authority of the Secretary General

INTERNATIONAL CIVIL AVIATION ORGANIZATION

A period of night duty shall be defined as starting at (\*) [0130 local] and ending at (\*) [0529 local]

D3.3. NIGHT DUTIES

- A duty which covers all or part of the period of night duty shall not exceed (\*) [10] hours
- . No more than (\*) [3] consecutive duties shall be worked which cover all or part of the period of night duty.
- A minimum period of (\*) [54] hours shall occur between the end of duties which cover all or part of the
  period of night duty and the commencement of the next period of duty

Scientific and operational factors for consideration: A night duty shall be wholly or partly between the window of circadian low. Consideration should be given to the research with regard to shift length and night work. Recovery time from night duties should allow recovery from any sleep debt accumulated and reversion to normal sleep cycle rhythms.

#### D3. DUTY LIMITATION PARAMETERS

#### D3.1. DUTY PERIOD

- The duty period may not exceed (\*) [12] hours
- The aggregate of duty period hours may not exceed (\*) [200] hours within a defined period of (\*) [720] consecutive hours or (\*) [30] consecutive days

Doc 9966 – Annex D for ATCOs

- . There must be at least (\*) [12] hours between the end of one duty period and the beginning of the next
- No more than (\*) [6] consecutive days of duty shall be worked
- If the maximum number of consecutive days of duty is rostered, there shall be a minimum interval of (\*) [60] hours between the end of one consecutive period of duty days and the next

Scientific and operational factors for consideration: There may be variable limits of duty period throughout the day which reflect task complexity and workload requirements as well as time of day and circadian disruption. There must be sufficient time between duty periods for suitable sleep. The cumulative effects of fatigue over a period of days should be considered.

#### D3.2. OPERATIONAL DUTY

- No period of operational duty shall exceed (\*) [2] hours
- No operational duty shall exceed (\*) [2] hours without there being a break taken during or at the end of that period
- A break should total not less than (\*) [30] minutes

Scientific and operational factors for consideration: Time in the controlling position should be limited based on complexity of task and workload. Breaks should provide sufficient time away from tasks to allow individuals to resume work with a sufficient level of performance. Breaks could be structured to allow napping or sleeping opportunities if appropriate.

The room for interpretation is very wide... what happens ,within' the 12 hours or 2 hours is also not defined...

#### Draft: Comparison of Rostering Guidelines across 6 ANSPs from Europe/North America

Note 1: generally these apply to ACC. Towers across Europe tend to operate differently\*

Note 2: Most respondents advise that these are their general guidelines. There are variances espeically driven by network planning and seasonal

changes								
2017/373 Rostering Requirements	ICAO Guidelines (Appendix D)	ANSP1 ACC/APR	ANSP1 Regional Airports	ANSP2	ANSP3	ANSP4	ANSP5	ANSP6
Maximum number of hours per duty period	12 max	12,5	12,5	7 (morn), 8 (afternoon)		10 (day) and 12 (night)	7,5 and 8 in ACC but with a 15 hour long shift*	12 max
Maximum number of hours per night duty	10 max	Different by unit but exc	eedin Recommended	9 (long overnights)	9	12	15 - once per week	12
Extended hours of duty time permissible	Not recommended	Not defined - only 'opera		, ,	Not allowed	Not allowed	100 min	Not allowed
Normal provision of air traffic	Not specified	100 min	Different per unit	80 min	80 min	100 min	120 min	120 - high cognitive conditions / 240 low cognitive conditions
Maximum duration of provision of air traffic control services without a break		120 min Day (only once) / 135 mins Night (only once)	120 min Day (only once) / 135 mins Night (only once)		120 min max	120 max		240 max
Maximum consecutive day shifts	6 (if so, there shall be 60 hours between next cycle)	4	,	ANSP2 operates a 5 shift system that roates: 3 on, 2 off		4	6	240 max 8
Maximum consecutive shifts including nights	6	5	6	Rotational - but ends up being 3 days on and 2 off	6	5	6	6
Maximum hours work per week (Mon-Sun)	50 (or 200 hours per 30 day period)	60	60	60 (max!)	48	50		72 hours per week (8 day cycle)
Ratio between duty periods and breaks in the provision of air traffic control services		25%	19%	At least 3 per day	N/A	N/A	Not answered	Not answered
Maximum number of consecutive duty periods extending into the night, if required by the operating hours of the ATC unit concerned.	3	2 or 3 consecutive night duties	3	2	3	3	3	3
Minimum duration of the rest period following a duty period extending into the night	12 hours minimum	Min 8 by permission otherwise 11 hours	Min 8 by permission otherwise 11 hours	12+	Unknown	12	10	10
How many hours maximum can a controller spend at a workstaion?								4

## **Fatigue in ATC and Engineering**

#### **Managing Fatigue**

- Fatigue Policy
- Fatigue training
- Investigators trained
- Internal 'audits'
- Adhere to CAA Regulator's Working time limitations
- 'Local modifications' for busier operations (terminal control)
- Rest facilities

#### **Measuring Fatigue**

- Engineering: Self-report surveys including workload and fatigue (Sam-Perelli and Karolinska sleepiness scales both used).
- ATC: existing reporting system (STAR).
- Managers fatigue training module spot signs of fatigue and how to deal with it.
- Review reports where fatigue was identified as contributing factor

### How is Fatigue measured at Austro Control?

ATCO surveys

Engineering surveys

Existing reporting systems

Analysis of reports (MORs and observations)

Time in Position vs Complexity vs Monitor

**Values** 

#### Thinking ahead...

- Unique fatigue reporting form?
- Integration of FRMS with IMS
- Change the language around fatigue?
- Fatigue + Boredom + Monotony?

1. Rostering = High level monthly plan

Austro Control example

2. Time-in-Position = day to day variation

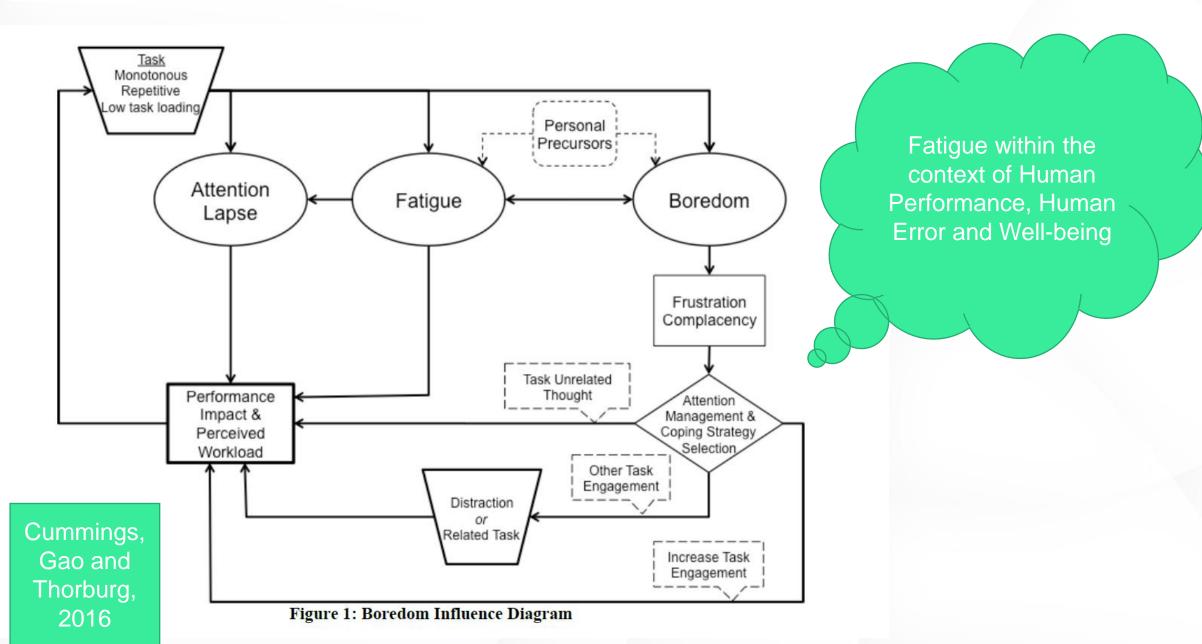

3. TiP compared with Traffic and Complexity

4. Results compared with Feedback, Wellbeing and Leave balances

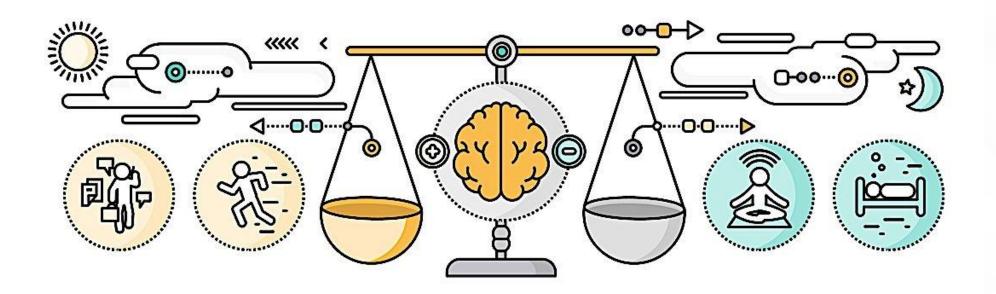

# Fatigue, Distraction, Well-being... The future is integrated

 Mental Health is having an effect on Safety and Performance already... Covid showed us that human performance and safety issues have shifted and are affected by well-being

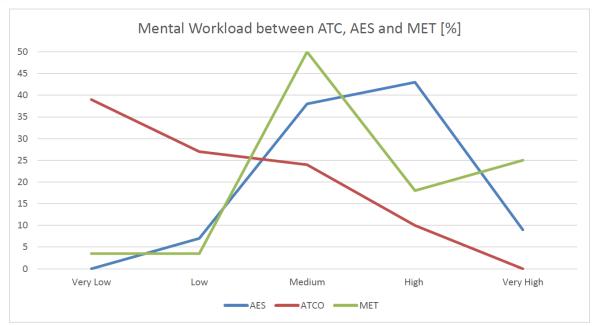

Figure 6 - Workload Comparison between ATCOs, AES and MET

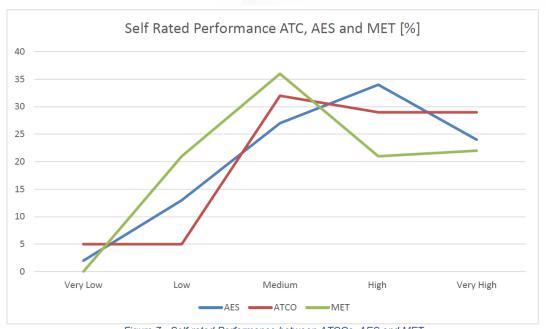

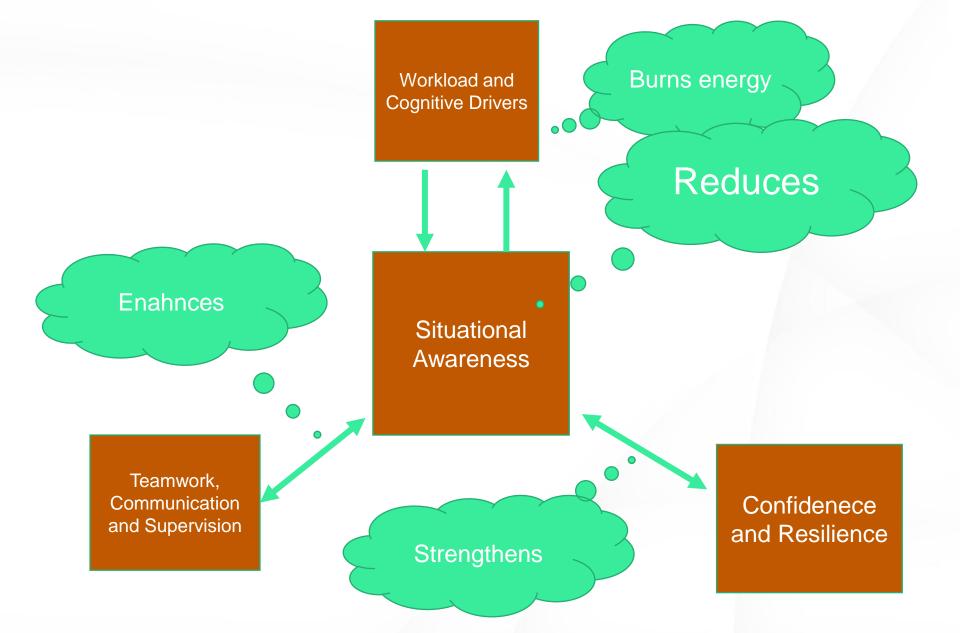

Figure 7 - Self-rated Performance between ATCOs, AES and MET

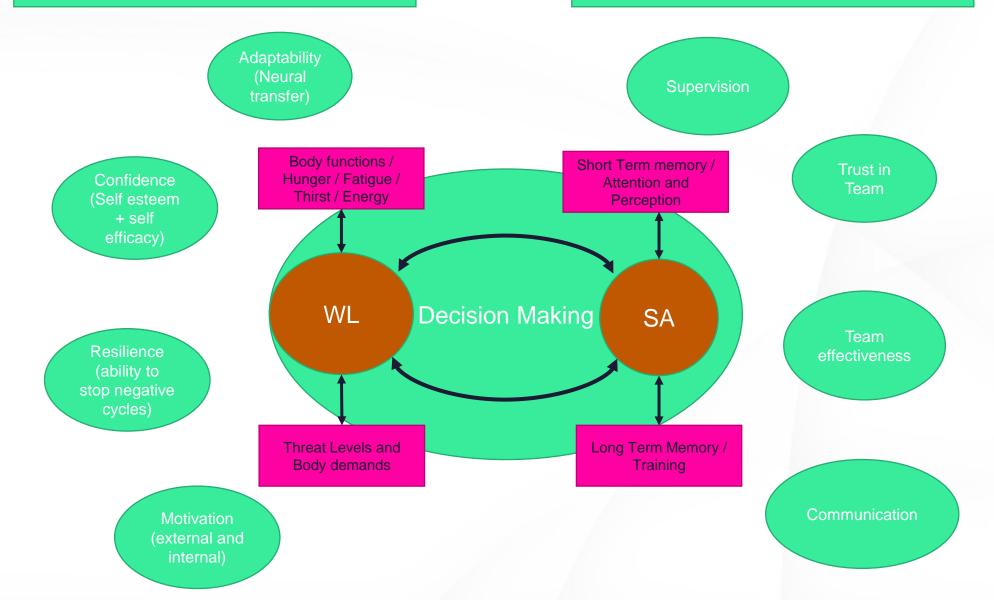

## **NATS Case Study**

#### Managing risk of fatigue in Engineering

- Engineering changed shift pattern to align with ATC shift pattern
- Self-report data from engineers, every 3 months over the last 18 months since implementation
- Human Factors Specialists (owner of the Fatigue Policy) ensures policy is adhered to and assess fatigue controls in place.
- Evidence gathered and recommendations made.

NATS blog on working night shifts: <a href="https://nats.aero/blog/2020/03/shift-survivors-how-air-traffic-controllers-cope-with-night-working/">https://nats.aero/blog/2020/03/shift-survivors-how-air-traffic-controllers-cope-with-night-working/</a>

# Discussion points as required

#### **Fatigue Management**

- Are we managing Fatigue correctly?
- Is rostering all there is? Can technology help us?
- Is our work becoming 'more boring' and 'more monotonous'?
- Should Fatigue be 'managed' or just eradicated?

What is the impact to selection / recruitment and competencies in the future?

#### **Mental Health**

- How much focus is given to maintaining Mental Health amongst ATCOs and Operational Engineer
- Do organisations take a proactive approach to training Resilience and Confidence?
- Do organisations have facilities (other than CISM) to react to mental health issues?
- Aside from HR, is Mental Health discussed and kept an eye on at your organisation?
- Will there be a 'burnout creep' in the coming years?

THANK YOU
