Quality Assurance DOC 9906 Vol 1

Step 7: Conduct Safety Activities

ICAO AFPP Workshop 3rd – 6th November 2015 Nairobi

Safety activities in Doc 9906	
Safety Concept and Wording	
Safety Assessment methodology	
Role of State	
Conclusion	

☐ Doc 9906 provides some guidance. Fo	r more detailed information please
refer to the Safety Management Manual	(Doc 9859)

Extract of ICAO 9906 Vol. 1:

☐ Safety is generally defined as "freedom from unacceptable risk "

From a formal point of view, a system can only be considered to be safe for operational use if its inherent risks have been identified, assessed and agreed to be below predefined limits.

The Safety assessment for the IFP should focus on the following element:

The implementation of a procedure, looking at the interface with other procedures available in that location, the complexity and the workload imposed on ATC, cockpit workload, flyability, etc.

In other words:

what is the impact of the implementation of a new procedure in an existing ATM system?

Assumptions: The FPD is assumed "Safe" as validated by the authority

The Safety assessment should not focus the FPD itself

Note: See previous slide – i.e., the FPD is assumed "safe" as it is validated by the Authority

The Safety assessment is part of the Procedure Approval Process

Safety Concept & Wording – Reason for safety

Why doing safety?

- To avoid dangerous situations
 - To react appropriately to dangerous situations (Reactive Mitigation Mean)
 - To prevent incidents and above all accidents (Preventive Mitigation Mean)
- And to ensure **conformity to the regulation**: Annex 19 « safety management » of ICAO defines in appendix 2 (Framework for a SMS) the requirement for the service provider:
- ☐ To develop and maintain a <u>process of identification of the</u> <u>modifications</u> that could affect the safety level of his product and services

Safety Concept & Wording

Main concepts used in safety analysis are:

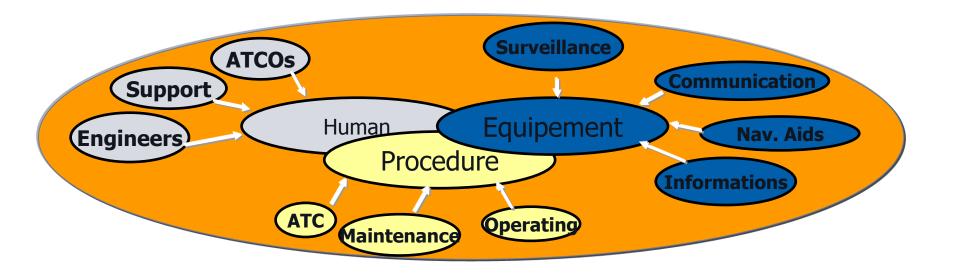

- ATM system
 - Hazard
 - Severity
 - Probability of occurrence (likelihood)
 - Risk
 - Mitigation Mean:
 - ▶ Mitigation mean to reduce the likelihood (Prevention)
 - ▶ Mitigation mean to reduce the severity (Reaction)

Safety Concept & Wording – ATM system

ATM system includes Equipment, Procedures and Human:

All these components interact in order to provide ATM services

Safety Concept & Wording – ATM system

Examples of modification of the ATM system:

- ☐ Equipment (hardware & software)
 - ✓ Implementation of a new equipment (new radar system, ...)
 - ✓ Modification of an existing equipment (update of the flight data processing system software...)
- Procedures
 - ✓ Modification of the airspace
 - ✓ Creation / modification of operational procedures
 - ✓ Implementation / modification of RNAV procedures
- Humans
 - ✓ Modification of the working method

Any of these modifications is subject to a safety assessment

Safety Concept & Wording - Hazard

A hazard is a an undesirable event regarding the ATM services and that could cause an accident.

It may be identified by the users (controllers, pilots).

Examples of hazards:

- Loss of radar display of the ATCO
 - Display of erroneous radar information to the ATCO

Safety Concept & Wording - Hazard

A **hazard** is characterized by its:

- Severity
 - Probability of occurrence (likelihood)
- The **severity** expresses the consequences of the hazard on flight safety. These consequences are assessed on :
 - Flight crew and controllers (workload...)
 - Functional capacities of ground and airborne systems
 - Ability to provide air traffic management services safely
- The **probability of occurrence** expresses the number of time the hazard could be observed by the users (pilots, controllers) over a given period.

Safety Concept & Wording - Severity

The severity is:

- Proportional to the operational consequences of the hazard
- Evaluated on a five-level's scale (from "Negligible" to "Catastrophic") using a severity table defined by the ANSP:
 - Severity A is assign to hazards with most critical effects
 - Severity E is assigned to hazards with less critical effects

Severity of occurrence	Meaning	Value
Catastrophic	Equipment destroyed Multiple deaths	Α
Hazardous	 A large reduction in safety margins, physical distress or a workload such that the operators cannot be relied upon to perform their tasks accurately or completely Serious injury Major equipment damage 	В
Major	 A significant reduction in safety margins, a reduction in the ability of the operators to cope with adverse operating conditions as a result of increase in workload, or as a result of conditions impairing their efficiency Serious incident Injury to persons 	С
Minor	 Nuisance Operating limitations Use of emergency procedures Minor incident 	D
Negligible	Little consequences	E

ICAO 9859 Safety Management Manual - Severity classification table

Note: Each ANSP should define its own table

Safety Assessment Methodology - Severity evaluation

Severity classification table

Severity Class	1 [Most Severe]	2	3	4	5 No safety effect [Least Severe]
Effect on Operations*)	Accidents	Serious incidents	Major incidents	Significant incidents	No immediate effect on safety
Examples of effects on operations Include*):	□ one or more catastrophic accidents, □ one or more mid-air collisions □ one or more collisions on the ground between two aircraft □ one or more Controlled Flight Into Terrain □ total loss of flight control. No independent source of recovery mechanism, such as surveillance or ATC and/or flight crew procedures can reasonably be expected to prevent the accident(s).	□ large reduction in separation (e.g., a separation of less than half the separation minima), without crew or ATC fully controlling the situation or able to recover from the situation. □ one or more aircraft deviating from their intended clearance, so that abrupt manoeuvre is required to avoid collision with another aircraft or with terrain (or when an avoidance action would be appropriate).	 large reduction (e.g., a separation of less than half the separation minima) in separation with crew or ATC controlling the situation and able to recover from the situation. minor reduction (e.g., a separation of more than half the 	controller or aircraft flight crew, or slightly degrading the functional capability of the enabling CNS system. minor reduction (e.g., a separation of more than half the separation minima)	immediate direct or indirect impact on the operations.

ESARR 4 severity classification table Eurocontrol Safety Regulatory Requirements

Safety Concept & Wording – Probability of occurence

The probability of occurrence is:

- Proportional to the causes of the hazard
- Evaluated on a 5 level scale (from frequent to extremely remote) using a probability of occurrence table defined by the ANSP
- Can be evaluated with a qualitative or quantitative approach

	Meaning	Value
Frequent	Likely to occur many times (has occurred frequently)	5
Occasional	Likely to occur sometimes (has occurred infrequently)	4
Remote	Unlikely to occur, but possible (has occurred rarely)	3
Improbable	Very unlikely to occur (not known to have occurred)	2
Extremely improbable	Almost inconceivable that the event will occur	1

ICAO 9859 Probability of occurrence classification table

Frequency	Meaning	
Extremely Rare	Can occur once in 1000 years at a given ATC center (or has never happened before)	
Rare	Can occur oince in 5 to 10 years at a given ATC center	
Occasional	Can occur once to twice a year at a given ATC center	
Likely	Can occur several times per year at a given ATC center	
Numerous	Can occur several times per month at a given ATC center	

French ANSP table

Safety Concept & Wording - Risk

The <u>risk</u> associated to an hazard is the **combination** of the **probability of occurrence** and the **severity**.

The **acceptability** of the risk is evaluated, based on the probability of occurrence and the severity, and using a <u>risk classification matrix</u> (defined by the ANSP).

	Risk severity				
Risk probability	Catastrophic A	Hazardous B	Major C	Minor D	Negligible E
Frequent 5	5A	5B	5C	5D	5E
Occasional 4	4A	4B	4C	4D	4E
Remote 3	3A	3B	3C	3D	3E
Improbable 2	2A	2B	2C	2D	2E
Extremely improbable 1	1A	1B	1C	1D	1E

Assessment risk index	Suggested criteria
5A, 5B, 5C, 4A, 4B, 3A	Unacceptable under the existing circumstances
5D, 5E, 4C, 4D, 4E, 3B, 3C, 3D, 2A, 2B, 2C	Acceptable based on risk mitigation. It may require management decision.
3E, 2D, 2E, 1A, 1B ,1C, 1D, 1E	Acceptable

Note: Each ANSP should define its own table

Safety Concept & Wording - Risk

Example of evaluation of the risk:

- "Loss of the radio communication" is evaluated as severity B
- Probability of occurrence of "loss of radio communication" is evaluated as occasional
- Based on the risk classification table, this risk is unacceptable.

	Risk severity				
Risk probability	Catastrophic	Hazardous	Major	Minor	Negligible
	Α	В	С	D	E
Frequent 5	5A	5B	5C	5D	5E
Occasional 4	4A (4B	4C	4D	4E
Remote 3	3A	3B	3C	3D	3E
Improbable 2	2A	2B	2C	2D	2E
Extremely improbable 1	1A	1B	1C	1D	1E

→ Mitigation shall be implemented to ensure the acceptability of the risk

MAIRBUS

Safety Concept & Wording – Mitigation Means

Mitigations Means are implemented	to manage the risk :
☐ Mitigation means can reduce the con	sequences of a hazard (severity): Reactive Mitigation Mean
☐ Mitigation means can reduce the Like	elihood of a hazard : Preventive Mitigation Mean

4 Steps Methodology

- 1) **Environment Description**
 - 2) Modification Description
 - 3) Hazards Identification & Mitigation Risk Matrix
 - 4) Safety Requirements & Assumptions

Step 1 – Environment Description (1/2)

- Operational Environment:
 - Description of the airspace
 - Description of the adjacent airspace
 - Meteorological conditions
 - Traffic flow
 - Significant obstacle
 - Restricted or dangerous area
 - Noise restriction area
 - Existing procedures (conventional, PBN)

Step 1 – Environment Description (2/2)

- Working method:
 - Seperation (Tactical or procedural)
 - Coordination
 - Phraseology
- Equipment:
 - Air/Ground communication means
 - Ground /Ground communication means
 - Surveillance means

Step 2 – Modification Description

- Modification Description:
 - Approach implemented
 - STARs implemented

Integration in the existing Air Traffic System

Step 3 – Hazards Identification

Question:

What is the impact of the implementation of a new procedure in an existing ATM system?

Feedback from operators, ATCOs?

Step 3 – Hazards Identification & Mitigation – Risk Matrix

- Hazards Identification
 - Effects and Consequences
 - Initial Severity
- Identification of Mitigation Means to reduce the Severity
 - Corrected Severity
- Identification of Mitigation Means to reduce the Likelihood
 - Corrected Likelihood
 - → Check that Risk is acceptable

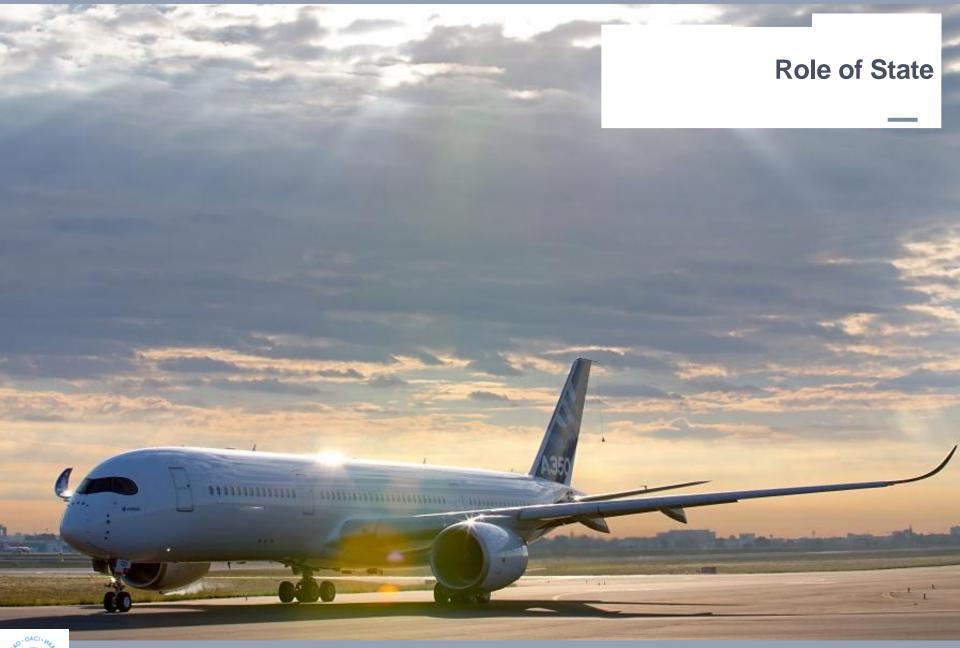

Note: Need the Severity/Likelihood/Risk Matrix

Step 4 – Safety Requirements & Assumptions

- All Mitigation Means are derived in:
 - Safety Requirements (SR)
 - Assumptions
- Identify
 - Responsible in the entity to put in place the SR
 - Planning to put in place the SR

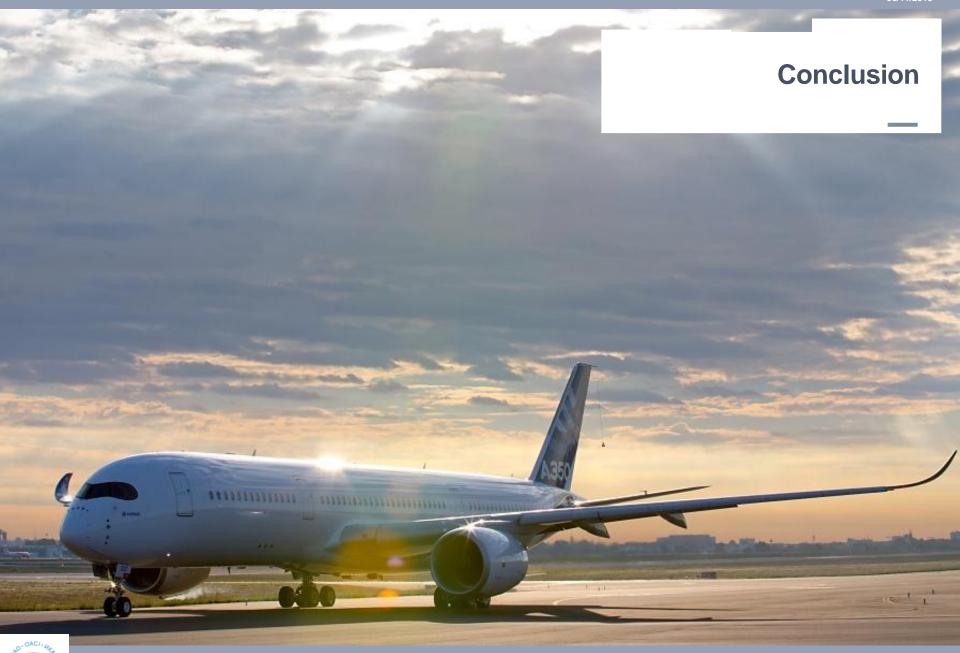

What is the CAA implication?

- Provide the Safety Assessment responsible/Organisation
- Severity/Likelihood/Risk Matrix published by the State
- Validate/Approve the Safety Assessment
- Audits (all mitigation means should be stated and followed-up)

The Safety assessment is part of the Procedure Approval Process

Quality Assurance Introduction
