# Improvement of ground validation Comprehensive verification methodology Pilot ground validation

**Corinne Bousquet  
DSNA/DTI**

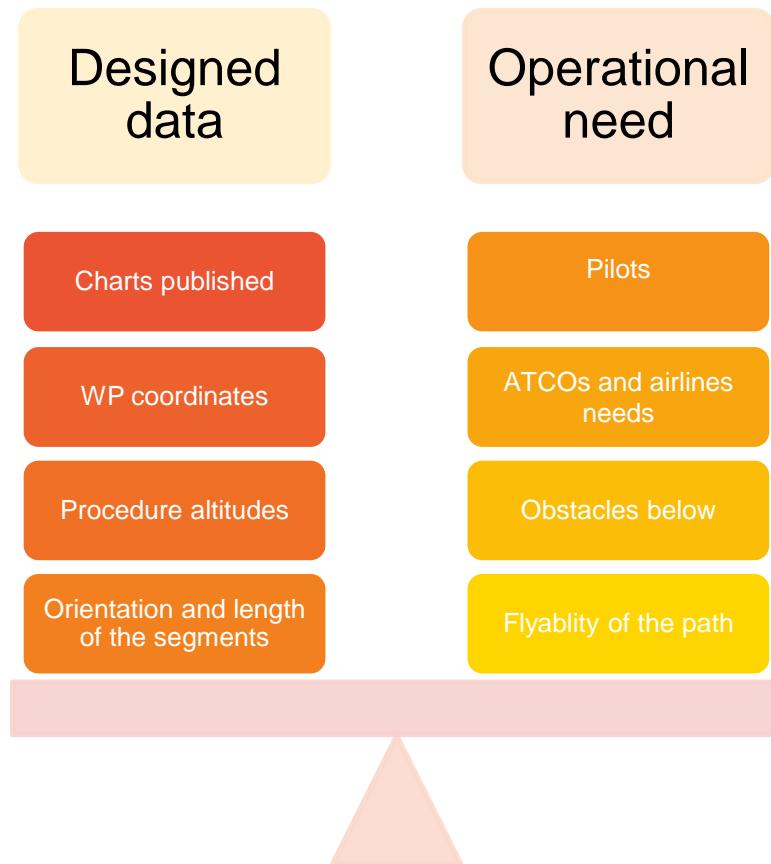

[corinne.bousquet@aviation-civile.gouv.fr](mailto:corinne.bousquet@aviation-civile.gouv.fr)

# 1. Why is flight validation required in the procedure design process?

# Why flight validation?

Mainly to check whether the data produced by the design process is in balance with:

- Aircraft performances,
- Airlines and ATCOs requirements,
- Obstacles,
- Local environmental constraints,
- Pilots understanding.

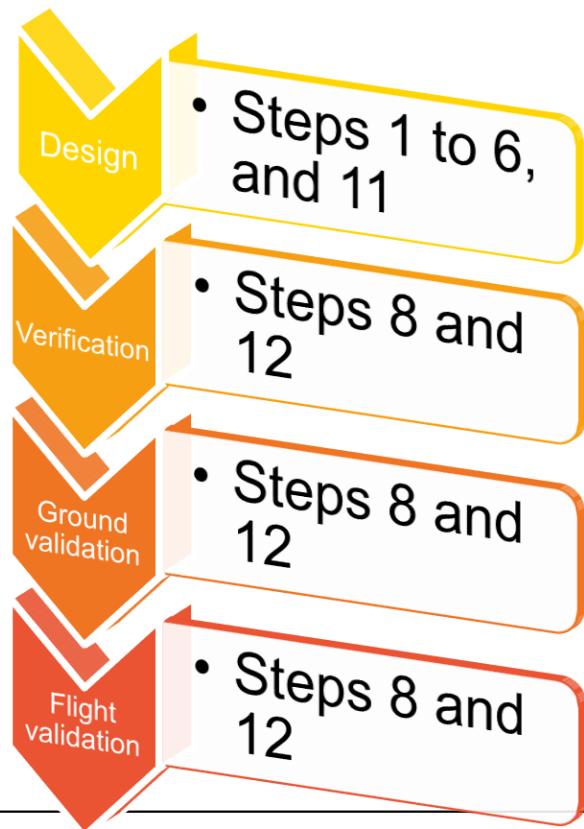

## 2. How to consolidate the designed data and make sure that balance is achieved?

# By using a robust Design Process

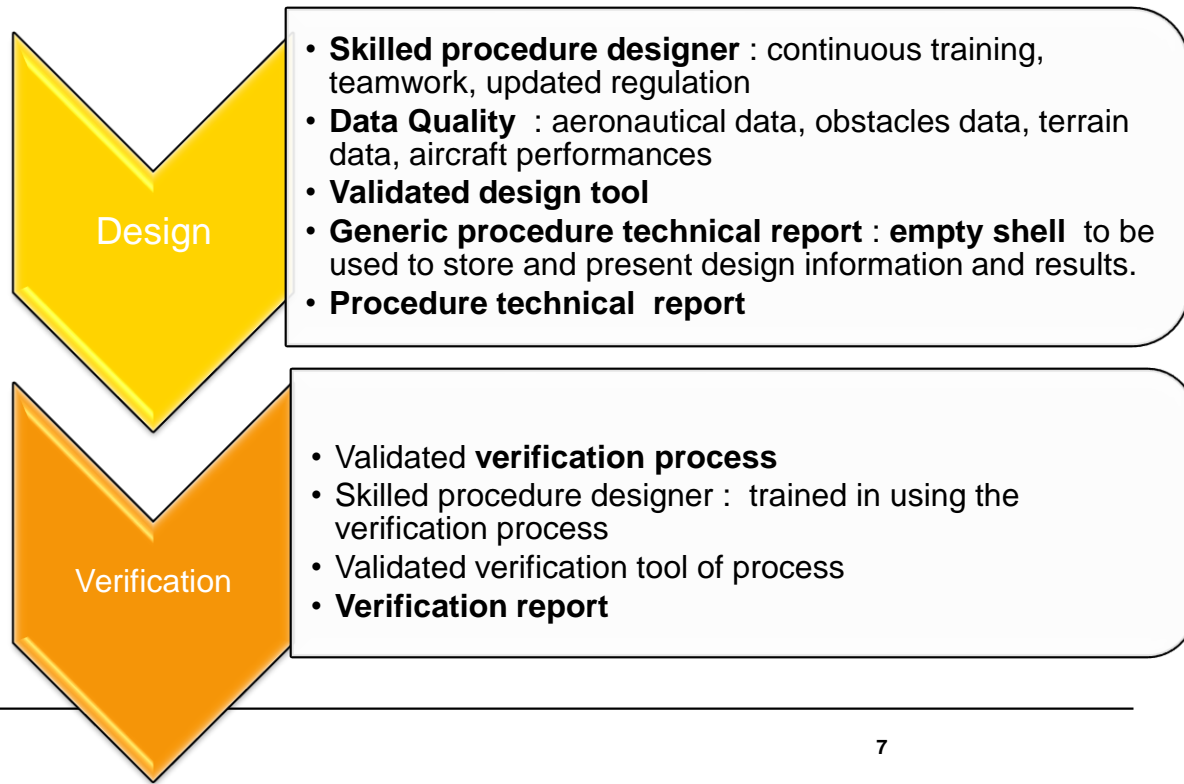

Well described in doc 9906  
to seek and obtain balance  
and safety of flight in four steps.

*“This process includes review,  
verification and validation processes  
which are necessary to minimize  
the possibility of errors.”*

# Continuous **improvement** of the design process

**Design** and **Verification** steps are keystones of IFPD. If they are robust enough, they reduce the weight of the next steps.

# 1. Yes of course, but I am not comfortable with the verification.

# Verification process

## Procedure Technical Report

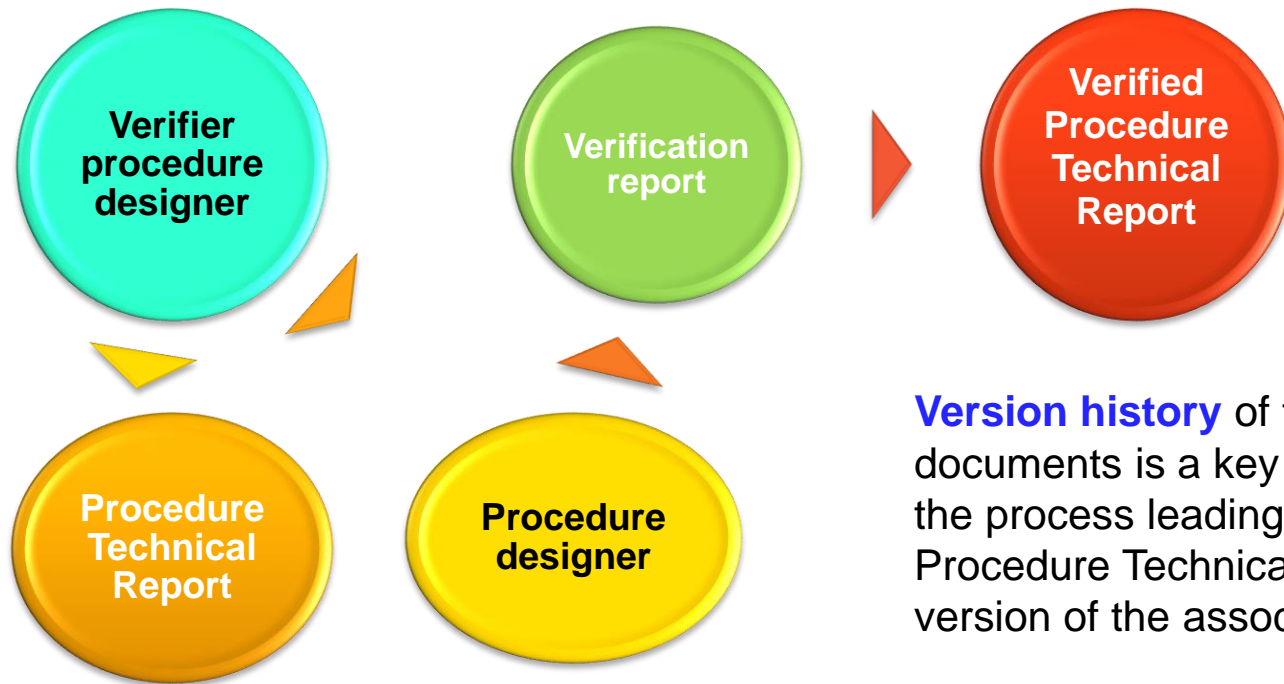

**Doc 9906 describes the basis of the verification process :**

### 7.5.3.1 Documentation

*On the basis of these activities, the resulting FPD usually comprises one or several draft procedure layouts, a textual description of the procedures as well as calculations and coordinates.*

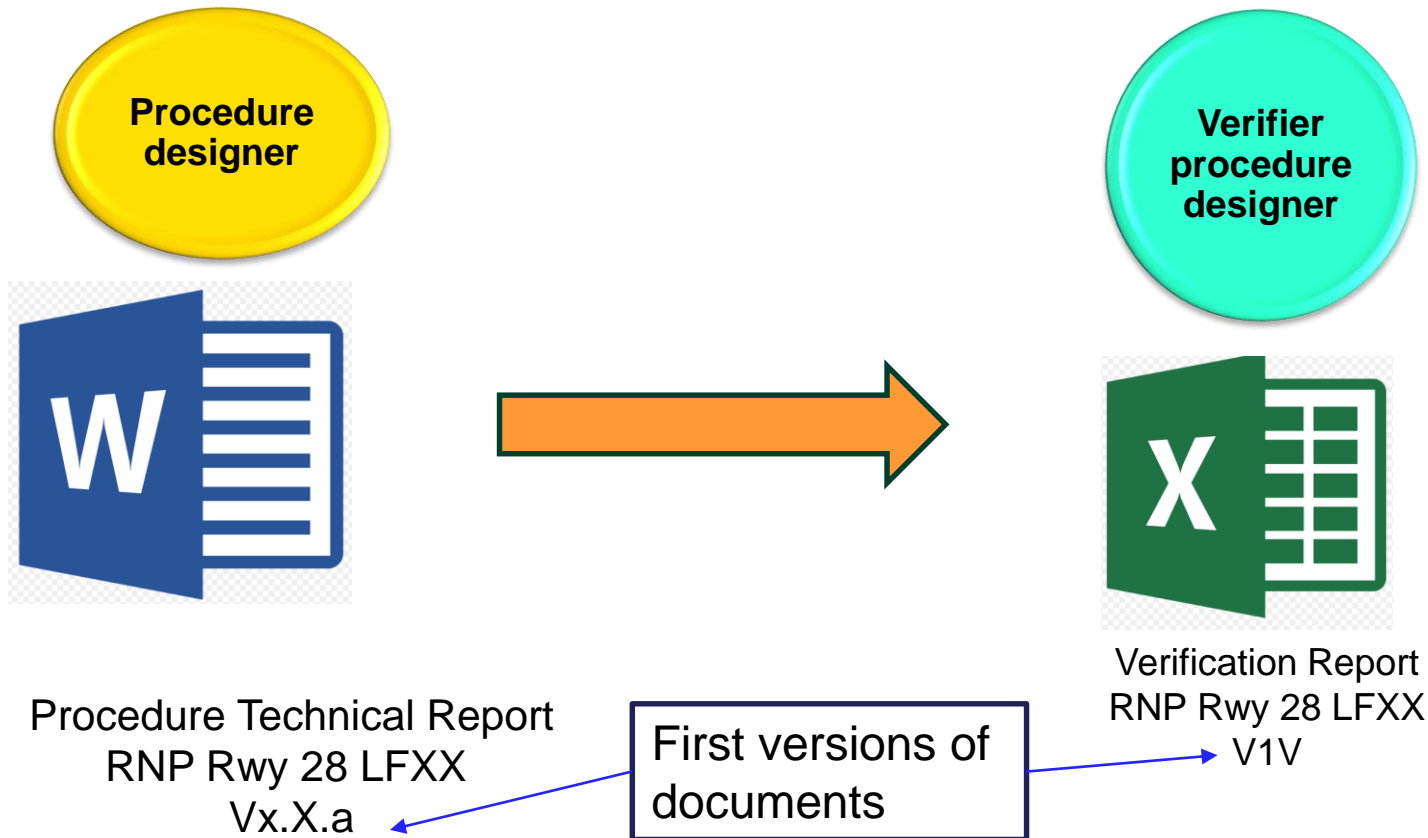

*These documents are then used as a basis for the design verification and are the input for the determination of the level-of-safety impact of the design. All aspects of the FPD process should be documented including: .../...*

# Verification : Actors? Inputs? Outputs?

**Version history** of the exchanged documents is a key element of the process leading to the final version of Procedure Technical Report **WITH** the final version of the associated Verification Report

### **3. Yes, but do I need a pilot in the loop after a solid verification process?**

# Yes Pilots should be in the loop from ground

- With a pilot to **check from charts** :
  - **path flyability** and
  - information published on chart **clear and complete**
- Ground validation report

# Yes Pilots could be in the loop from flight deck

Flight  
validation

- With a plane
- With a flight simulator
- With IAC (for the pilot) and navigation data in the navigation data base (for the navigation system)
- **Flight validation report**

### **3. Are you sure that only one pilot and one aircraft are enough?**

# End of the story

# Conclusions

Consolidation of the design process by increasing the strength of the verification step is mandatory.

Pilots are requested to look at the procedure from an operational point of view to check flyability and information displayed on the IAC.

Pilots might be requested from a flight validation point of view in specific situations (new criteria, special procedure, difficult environment ...)
