SWIM Business Requirements: *How AEROTHAI Developed Our Use Cases*

Sugoon Fucharoen (Kin)

SWIM Business Requirements Brainstorming

6 – 7 November 2023

Target Outcome:

An understanding of how to develop business requirements (operational scenarios) for SWIM development

- ☐ What is the role of operational scenario in SWIM development?
- ☐ How does a scenario get developed...
- ☐ ...and how does it get used?
- ☐ AEROTHAI's Use Cases and Experience

Agenda Item 3 (b)
7-10/05/19

 **ICAO** International Civil Aviation Organization
The Third Meeting of System Wide Information Management Task Force (SWIM TF/3)
Bangkok, Thailand, 07 – 10 May 2019

Agenda Item 3: b) Task 1-2: SWIM Regional Roadmap

A SWIM IMPLEMENTATION PHILOSOPHY AND ROADMAP
(Presented by Singapore, Thailand, USA)

SUMMARY

This paper proposes a philosophy to SWIM implementation in the Asia-Pacific region and a first draft of the roadmap needed to embark on this implementation.

1. INTRODUCTION

1.1 This paper lays out the overarching philosophy to the development of the Asia-Pacific SWIM implementation roadmap as well as the proposed roadmap for implementation.

1.2 The implementation philosophy defines the approach and provides the rationale for how the roadmap is developed and the background information to understand the roadmap.

1.3 The implementation roadmap is a series of tasks and milestones that needs to be achieved before an Asia-Pacific SWIM becomes a reality.

2. DISCUSSION

2.1 SWIM Implementation Philosophy

2.1.1 In the ICAO Doc 10039 Manual on SWIM Concept, it is stated that SWIM, in and of itself has no operational benefit. SWIM is an enabler that facilitates information exchange in support of operations. In other words, SWIM provides a harmonized means for information exchange.

2.1.2 As SWIM is not developed and implemented for its own sake, the SWIM implementation philosophy lies in identifying operations that would benefit from the implementation of SWIM. Based on the operations identified, the services required to support those operations can then be effectively specified. After that, SWIM governance that are considered necessary for the implementation and usage of such services to support those operations can be built.

This bottom-up principle will help provide the clear justifications to implement the SWIM infrastructure needed to better and more efficiently support the operations. Once the services are implemented and utilized to support this first operation, reflecting the advantages of using SWIM, the same process can be continuously applied to other operations considered important and requiring more effective information exchange for the region.

(APAC SWIM Implementation Philosophy)

“[...], the **SWIM implementation philosophy** lies in identifying operations that would benefit [...].”

“The bottom-up principle will help provide the clear justifications to implement the **SWIM infrastructure** needed to better and more efficiently support the operations.”

Developing an Operational Scenario

Case Study: the Ground Delay Program (GDP)

Transforming the foreseen/expected airborne delays into ground delays for better predictability and efficiency

ADEP: RJAA

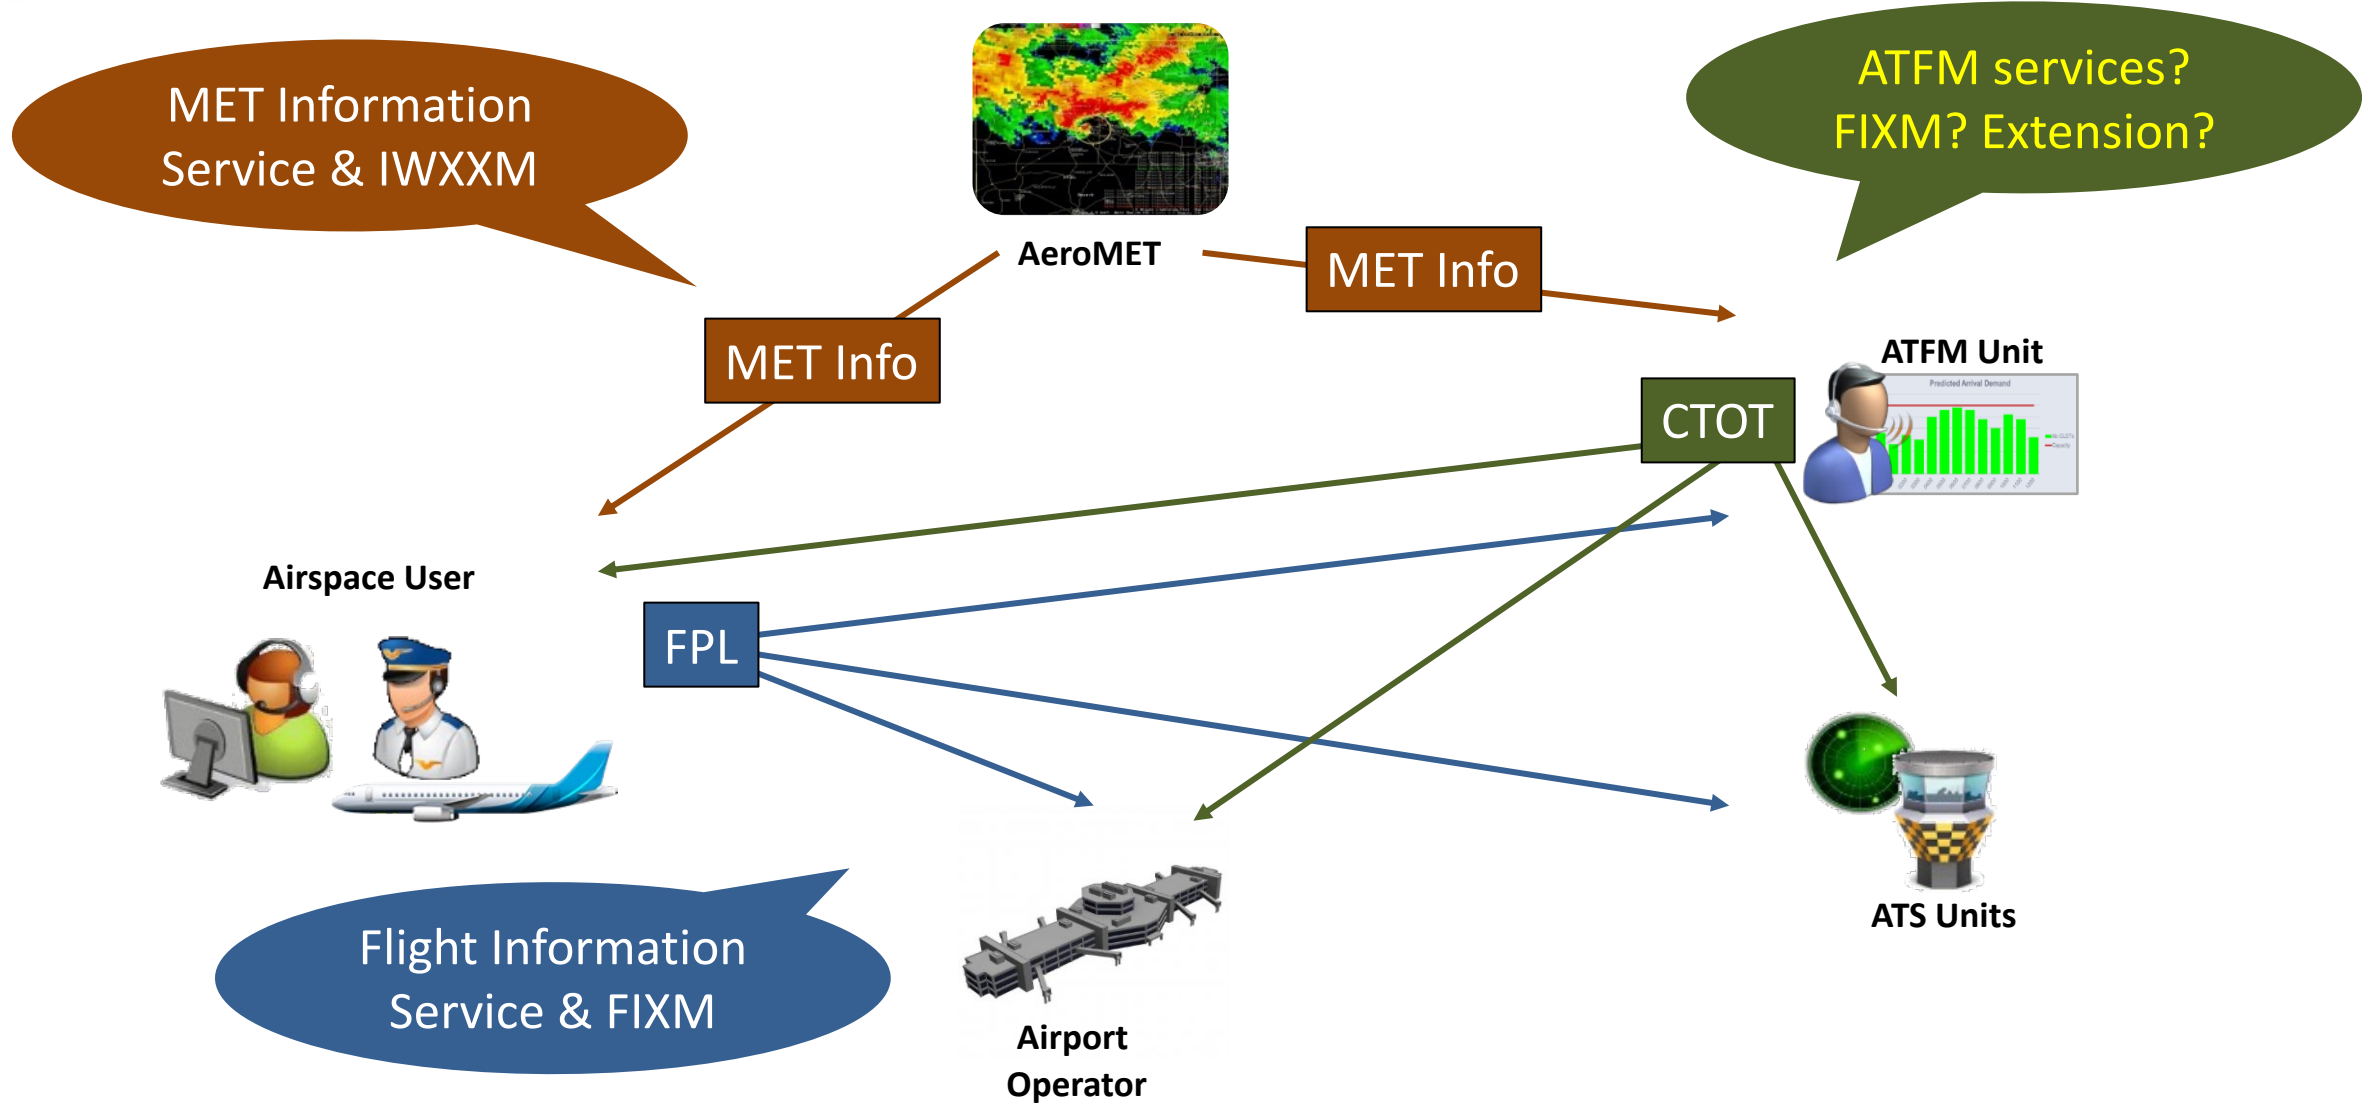

CTOT

ADES: VTBS

Capacity – 30%

From Information Flow to Ops Requirement

AEROTHAI Aeronautical Radio of Thailand
ศูนย์วิทยุการบินแห่งประเทศไทย

Name
GDP Activation for Airport
Brief Description
This scenario focuses on the activation of Ground Delay Program (GDP) and distribution of Calculated Take-Off Time (CTOT) to manage the arrival traffic demand at an airport, after an arrival ATFMU has determined that unconstrained demand will exceed the airport capacity (AAR).
Actors
1. Arrival ATFMU 2. Departure ATFMU / ATSU 3. Airspace User (AU) 4. Airport Operator (AO)
Pre-conditions
1. Arrival ATFMU has performed demand prediction and monitoring, and has determined that unconstrained demand will exceed airport capacity (AAR) 2. Arrival ATFMU has sufficient support system to generate, distribute, and manage CTOTs 3. Departure ATFMU / ATSU, AU, AO understand the operating procedure on CTOTs 4. Standard Taxi-Out Time (STT) from departure airports have been agreed (*or use default*)
Basic Flow of Events
<u>ATFM Daily Plan Distribution and CDM Web Conference</u> 1. Arrival ATFMU generates ATFM Daily Plan (ADP) <i>either auto or manual</i> 2. Arrival ATFMU distributes* ADP to AU, AO, and Departure ATFMU along with call for CDM web conference <i>*ADP delivery currently relies on e-mail; this can be revised once there is an agreement on how to deliver this under SWIM environment*</i> 3. AU, AO, Departure ATFMU join CDM web conference to discuss the situation
<u>GDP Activation and CTOT Distribution</u> 4. AU submits FPL as per standard process 5. Arrival ATFMU extracts relevant information from the basic FPL a. Flight ID – ACID, ADEP, ADES b. Timing parameters – EOBT, EET 6. Arrival ATFMU generates relevant timing parameters to estimate arrival demand and calculate CTOT a. $ETOT = EOBT + STT$ b. $ELDT = ETOT + EET$ c. $CLDT = \text{Appropriately sequenced ELDTs}$

- d. $CTOT = CLDT - EET$
7. Arrival ATFMU distributes CTOT to AU, AO, Departure ATFMU
 - a. *CLDT can be distributed along with CTOT for information; compliance is taken at departure against CTOT*

Departure Facilitation

8. Departure ATFMU, AU, AO receives CTOT from Arrival ATFMU and prepare for compliant departure
 - a. Departure ATFMU alerts or forward information to relevant ATSU
 - b. AU: Operations Control Center (OCC) ensures flight crews are briefed or ensures CTOT is communicated to airborne flight **short turnaround case**
 - c. AO ensures gate planning takes into consideration CTOT
9. Departure ATSU facilitates departure in compliant to CTOT
10. Departure ATSU submits DEP message as per standard process
11. Arrival ATFMU extracts relevant information from the message
 - a. Flight ID – ACID, ADEP, ADES
 - b. Timing parameters – ATOT (DEP)
12. Arrival ATFMU logs the information for post-ops analysis

Required Data Elements

Data to be Exchanged

1. Flight ID – ACID, ADEP, ADES
2. EOBT
3. EET
4. CTOT, CLDT
5. ATOT

Locally-Derived Data

1. ETOT
2. ELDT
3. ALDT

Required Information Services

Flight ID, EOBT, EET, CTOT, CLDT, ATOT → Flight information service
ADP → ADP service

From Ops Requirement to Technical Enablers

Required Data Elements

Data to be Exchanged

1. Flight ID – ACID, ADEP, ADES
2. EOBT
3. EET
4. CTOT, CLDT
5. ATOT

Locally-Derived Data

1. ETOT
2. ELDT
3. ALDT

Required Information Services

Flight ID, EOBT, EET, CTOT, CLDT, ATOT → Flight
ADP → ADP service

APAC CNS SG/20

Current Chair:

Dr. Amornrat J., AEROTHAI

Conclusion APAN/IRG/30/12 (CNS SG/23/6-SWIM TF/3/4) - Asia/Pacific Regional FIXM Extension for ATFM	
What: That, noting: 1. the need for interoperable system-to-system information exchange to support the implementation and automation of cross-border ATFM in the Asia/Pacific Region; and 2. the data attributes included in the Asia/Pacific FIXM version 4.1 Extension were endorsed by ATFM/SG.	Expected impact: <input type="checkbox"/> Political / Global <input checked="" type="checkbox"/> Inter-regional <input type="checkbox"/> Economic <input type="checkbox"/> Environmental <input checked="" type="checkbox"/> Ops/Technical
The Asia/Pacific FIXM version 4.1 Extension described and provided in Appendix A to the Report on agenda item 3.4 be adopted and uploaded to the ICAO APAC Regional Office website for immediate use by Asia/Pacific Administrations, where the capability to do so exists, for cross-border ATFM information exchange.	
Why: To provide the information exchange model necessary to support cross-border ATFM in the Asia/Pacific Region, in order to support the implementation of the performance objectives of	Follow-up: <input checked="" type="checkbox"/> Required from States

Some Final Words **Lessons Learned from Scenario Development**

AEROTHAI Aeronautical Radio of Thailand
ศูนย์วิทยุการบินแห่งประเทศไทย

As You Work on the Brainstorming...

- ✓ **Start with the basic**
 - What are you doing now on the Ops floor that can benefit from SWIM-based communication?
- ✓ **Then make a wish list**
 - What are some things that you need but cannot do with the current information exchange technologies? What data/information will help?
- ✓ **Break it down clearly**
 - How does it work step-by-step, and what is the flow of data elements in the process?
