Air Traffic Management Bureau. CAAC

Human factors (77.4%)

1. Fogetten aircraft、vehicles or personnel on the runway
2. Wrong issued regulatory license or instruction
3. Misjudge or confuse the location of an aircraft, vehicles, or personnel
4. Failure to use standard radio call terms as required
5. The pilot and the vehicle driver misunderstands the controller's instructions
6. The controller did not find an error in the pilot or the driver

Environmental factors

1. Temporary change the direction of the runway in use
2. Multiple towers, multi-runway operation
3. Airport ground signs, lights and symbols are incomplete or unclear

Analysis of runway incursion causes

1. Communication, monitoring of equipment failure
2. Malfunction or interference of the cockpit equipment

1. Regulatory operation procedures are missing or imperfect
2. Administrators are overworked or undertrained
3. A lack of runway safety management and coordination mechanism between the control tower and the airport maintenance department

equipment factors

management factors

Runway incursion causes statistics

pilots 18%
control 8%
ground security (vehicles, pedestrians, animals) 26%
other 48%

FROM CIVIL AVIATION SAFETY NET OF CHINA

Key points

1. How to reduce the safety loopholes caused by human factors (air traffic control, pilots, vehicle drivers, etc.)?

2. How to timely locate the incursion position and alarm?

3. How to choose the right technology to maximize returns with minimal investment?

4. How to increase the safety barrier without reducing the operation efficiency?...

The content of this SP is mainly about human factors of the pilots, controllers and vehicle drivers.
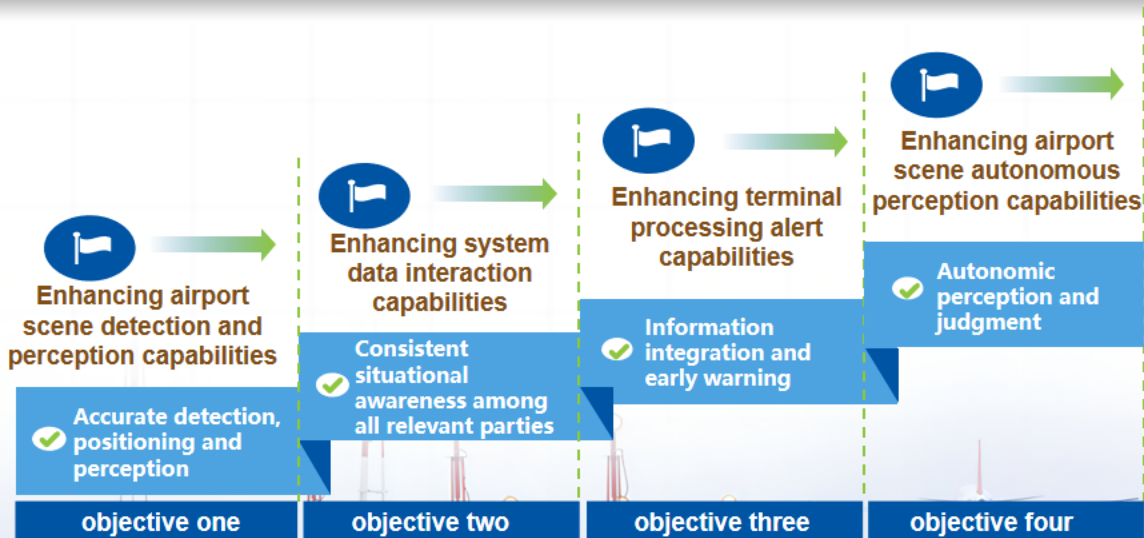

Enhancing airport scene detection and perception capabilities

Accurate detection, positioning and perception

objective one

Enhancing system data interaction capabilities

Consistent situational awareness among all relevant parties

objective two

Enhancing terminal processing alert capabilities

Information integration and early warning

objective three

Enhancing airport scene autonomous perception capabilities

Autonomic perception and judgment

objective four

2 Overall Objective

System facing the pilots / vehicle drivers

| Runway state light system | Stop the exhaust lights | Light guidance system | ground-space data chain | 5G AeroMACS |

mobile end system/aircraft FMS

A regulatory-oriented terminal system

Tower control and automation system
(A-SMGCS、Tower ATMAS、EFS)

voice recognition

Scene monitoring source

| Field monitor radar | Multi-point positioning system | secondary radar | ADS-B | video system |

Enhancing airport scene autonomous perception capabilities

Enhancing system data interaction capabilities

Enhancing terminal processing alert capabilities

Enhancing airport scene detection and perception capabilities

Technology implementation ideas

Part1: Research background

Part2: Overall objective

Part3: Key Technologies and Applications

Part4: Future Prospects

China's civil aviation is conducting research on the tower automation system's runway incursion prevention feature.

Enhancing airport scene detection and perception capabilities
- Traditional Technology: Surveillance Signals
- Innovative Technology: Video Signals
- Verification of vehicle BeiDou positioning signals
- Installation of Vehicle Beacon Devices

Enhancing system data interaction capabilities
- Interaction between Electronic Flight Strips & surveillance signals
- Verification of scene data interaction based on aviation 5G
- CPDLC for runway incursion prevention

Enhancing terminal processing alert capabilities
- The upgrade and optimization of Electronic Flight Strips
- Verification and application of speech recognition technology

Enhancing airport scene autonomous perception capabilities
- Runway Status lights
- Stop-Bar lights
- Vehicle safety management
- End-Around Taxiways

Part3: Key Technologies and Application

—Enhancing airport scene detection and perception capabilities

① **Traditional Technology: Surface surveillance signals**

All airports are actively advancing related work, some airports already have surface surveillance capabilities.

Surveillance signals: SMR 、 MLAT、 QUALIFIED ADS-B

Surveillance information: Target Identification, position, speed, altitude, etc.

➤ **Surveillance coverage:** entire apron, airport perimeter

➤ **Planning information:** Flight number, Mode-S code, 24-bit address code

➤ **Key Technologies:**
Related to achieving the goal, identifying target identity information, and integrating with airport maps, to realize a series of alarms related to target position, speed, and altitude.

② **Innovative Technology: Video Signals**

> **Key Information: Target Position Data, Target Motion Trends**

> **Providing panoramic surveillance and focused position monitoring**

Airports such as Hongqiao, Nanchang, Jinan, Wenzhou, among others, are actively applying optoelectronic technology, combined with electronic waybill data, to collectively enhance runway incursion prevention.

• Computational Efficiency
• Cross-Device Tracking
③ **Innovative Technology**
——**Verification of Vehicle BeiDou Positioning Signals**

Through on-site vehicle test runs, the following have been accomplished:

➤ **Verification of signal coverage;**

➤ **Verification of signal quality;**

➤ **Verification of signal accuracy and real-time performance;**
④ **Innovative Technology**
——**Installation of Vehicle Beacon Devices**

Key technology:

▶ Realizing MLAT vehicle positioning detection

▶ Improving Vehicle Positioning Accuracy

▶ Enhancing the accuracy of scene surveillance signal fusion

Hongqiao Airport is currently in the trial operation phase, and the following work will be carried out in the near future:

▶ Optimization of Vehicle Alarm Parameters

▶ Collaboratively develop management regulations for onboard beacon devices with the airport.

Vehicle plan

No.	Vehicle number	Status	Nature	Route	Auxiliary car
1	VA0003	Apply for	Circuit		
2	VA0001	Apply for	Circuit		
3	5464	Apply for	Circuit		
4	4226	Apply for	Circuit		
5	4781	Apply for	Circuit	.	
6	5463	Apply for	Circuit	.	
7	VA0002	Apply for	Circuit		

Part3: Key Technologies and Applications

——Enhancing system data interaction capabilities

⑤ **Interaction between Electronic Flight Strips & surveillance signals**

Key information:

Flight identity information, flight command status, runway operation mode

Key technology:

Combining surveillance signals, optoelectronic signals, and voice signals to jointly provide a series of alerts related to air traffic control commands.

Continuously enhancing the functionality of the Hongqiao Airport Tower electrical system in 2023:

➤ Integration of surveillance signals.

➤ Integrating graphical and digital modules to achieve real-time interaction between aircraft dynamics and the clickable status of electric flight strips.

➤ Enhancing functionality for status alerts and conflict detection.

⑥

Verification of scene data interaction based on aviation 5G

- Leverage 5G technology for validation;
- Complete a shared platform among air traffic control, airports, and airlines;
- Complete aircraft taxiing guidance scene tests;
- Complete runway incursion prevention scene tests.

Enhance operational mechanisms and foster greater situational awareness

⑦ **CPDLC for runway incursion prevention**

Key technology:

▶ Upload landing runway, arrival procedures;

▶ Real-time acquisition of aircraft operational parameters from the Flight Management System (FMS) to achieve flight intent recognition;

▶ Completing a comparison between landing runways and arrival procedures to provide error alert reminders, preventing incidents of landing on the wrong runway. (Bi-directional alerting)

⑦ **CPDLC for runway incursion prevention**

Work Progress Update:

▶ **Verification work completed in 2022;**

▶ **Planned joint discussions with airports and some airlines in 2024 to explore application implementation and detailed functionality based on actual operational work.**

▶ **STAR & Landing Runway publish**

▶ **Aircraft land on wrong Runway Alarm**
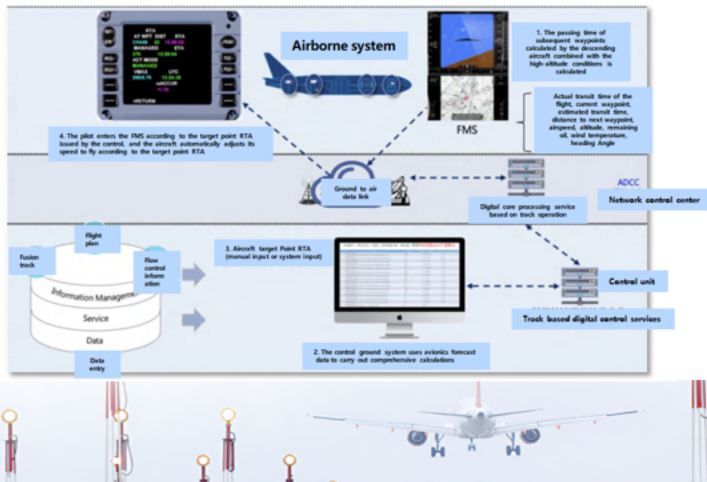

Part3: Key Technologies and Applications
——Enhancing terminal processing alert capabilities

⑧ **The upgrade and optimization of electric flight strips**

CES2225

CCA1507

Runway occupied. Do you want to proceed? YES NO

The command button turns gray, with a confirmation prompt upon clicking.

Sample: Takeoff conflict alert

⑧ **The upgrade and optimization of electric flight strips**

Combining surveillance signals with electric flight strips

CSH9396 ZGHA 0529 LND
APP A333/B A4254 240E
36R C C-D11

Sample: Reminder for missing landing instructions

When an aircraft on the five-mile final approach is within 2 kilometers of the runway threshold (configurable) and the electronic flight strip status of the aircraft is not in the LND state, a flashing downward arrow appears on the flight waybill to remind the controller that the landing instruction has not yet been issued.

⑧ **The upgrade and optimization of electric flight strips**

Combining surveillance signals, video signals, and electric flight strips
Sample: Unauthorized crossing Alert

If a flight crosses the stop/wait line without authorization from air traffic control, it will trigger an unauthorized crossing alert. The status in the waybill will turn red, and there will be a corresponding prompt in the alert message bar.

⑧ **The upgrade and optimization of Electronic Flight Strips**

When an aircraft is in the process of taking off or landing, if another target appears on or near the runway that threatens or affects the aircraft's normal takeoff or landing, an alert will be generated.

CQH8931 has crossed the hold short line

Combining surveillance signals with electric flight strips

Sample: Runway Incursion Alert

⑨ 🎤 **Verification and application of speech recognition technology**

东方幺幺三五跑道洞六号等待

Runway instruction reiteration consistency check

runway

runway

Intelligent runway incursion prevention based on speech recognition

Based on voice artificial intelligence, AI models identify bidirectional semantics of airport ground-to-air communication, combined with electronic process operation information and voice semantic information, to alert for conflicts with command intentions and crew execution instruction error.
⑨ 🎤 **Verification and application of speech recognition technology**

Instruction: CQH8762 is cleared to land on Runway 36R.
Intent: Landing, Runway 36R

Instruction: CES5503 is cleared to cross Runway 36R.
Intent: Crossing, Runway 36R

Recognition of crossing instructions when there is an inbound aircraft on the five-mile final approach

Instruction: CQH8762 taxi to and hold short of Runway 36R.
Intent: Taxi to, Runway 36R

Instruction: CES5503 taxi to and hold short of Runway 36R.
Intent: Taxi to, Runway 36R
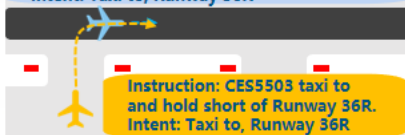

Recognition of taxi instructions when the runway is occupied

Instruction: CQH8762 taxi to and hold short of Runway 36R.
Intent: Taxi to, Runway 36R

Instruction: CES5503 hold short of Runway 36R.
Intent: Holding short outside of Runway 36R
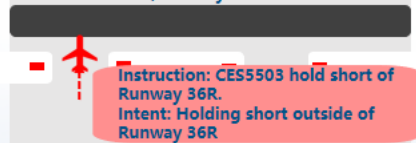

The flight has violated the hold short instruction.

Instruction: CQH8762 taxi to and hold short of Runway 36R.
Intent: Taxi to, Runway 36R

Instruction: CES5503 hold short outside of Runway 36R.
Intent: Holding short outside of Runway 36R
The actual position of the aircraft does not match the intended instruction.

Three Elements of Safety Inspection

Current position	Destination	Conflict
Integrated track information	Instruction intent recognition	Instruction intent recognition
Video scene monitoring coordinates	Scene operational rules	Integrated track information
Electronic Waybill	Instruction intent recognition	Video scene monitoring coordinates
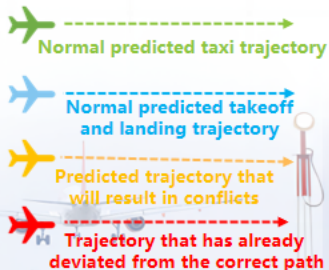

Normal predicted taxi trajectory

Normal predicted takeoff and landing trajectory

Predicted trajectory that will result in conflicts

Trajectory that has already deviated from the correct path

⑨ **Verification and application of speech recognition technology**

Combination of surveillance signals, voice, and Electronic Flight Strips (simulated schematic)

Part3:Key Technologies and Applications

——Enhancing scene autonomous perception capabilities

⑩ **Runway status lights**

Independent automatic operation & autonomous alerts

RWSL

飞机向跑道16R降落，跑道（停止）进入灯REL自动开启，以保证降落安全。

Anflug auf 16R, RELs schalten autom. zur Absicherung der Piste ein

Work Progress:
2017-2020: Preliminary research conducted as part of the technology project.
2021-2024: Project implemented, joint discussions held with air traffic control and crew to explore subsequent operation modes.

Key Technology: The runway status lights operate **independently** of air traffic controllers, controlled by internal logic to **illuminate** or **extinguish** runway entrance lights (**RELs**) and threshold lights (**THLs**). This enables accurate and timely indication of runway occupancy status, reducing the **frequency** and **severity** of runway incursions, and preventing runway **accidents**.

⑪ **Stop-bar lights**

➤ The tower electronic waybill system is linked with the airport's stop-bar lights, sending control signals to the lighting system and receiving feedback signals.

Work Progress:
2017-2020: Preliminary research conducted as part of the technology project.
2021-2024: Project implemented, joint discussions held with air traffic control and crew to explore subsequent operation modes.

⑪ **Stop-bar lights**

Work Progress Update:

Pudong Airport: Achieved integration of the Pudong Tower electrical system with the runway stop-bar light system, allowing control of lights and switching between

Category II /III operations via the chief's button.

Hangzhou Airport: Completed linkage testing and online upgrade of the backup system in the Hangzhou Tower electrical system. Hangzhou lighting upgrade completed and activated.

空中交通管理局
Air Traffic Management Bureau, CAAC

⑫ **Vehicle safety management and control**

Key technology: collaboration among ATC, airports, and airlines to collectively achieve vehicle perception

➤ Conduct flight verification tests based on the 5GAeroMACS network at Hongqiao Airport

➤ Integrate the dynamics of mobile area aircraft and vehicles into one system

➤ Accurately determine the precise locations of vehicles and aircraft

➤ Establish electronic fenced-off areas to prevent vehicles from entering runways and maneuvering areas

➤ Vehicle information is also integrated into electric flight strips and advanced scene systems

Vehicle mobile terminal actual interface

Part1: Research background

Part2: Overall objective

Part3: Key Technologies and Applications

Part4: Future Prospects

Continuously carry out runway incursion prevention work
Adhere to the principle of customization, one airport one solution

Focus on:

❯ Enhancing airport scene detection and perception capabilities

❯ Enhancing system data interaction capabilities

❯ Enhancing terminal processing alert capabilities

❯ Enhancing airport scene autonomous perception capabilities

Continuously optimize technology and implement new technologies
