

Flight Information Exchange Model

Arthit Tosukolvan

Aeronautical Radio of Thailand (AEROTHAI)

ATS Message: Overview

- ATS Messages are used to share flight plans including flight movements between AUs and ANSPs
- Format is teletype and defined in PANS-ATM (DOC 4444)

(FPL-ABC123-IS
 -A320/M-SDE1E2FGHIRWY/LB1
 -ADEP0655
 -N0460F340 SABIS Y8 SAVSA
 -ADES0103 ALTN
 -PBN/A1B1C1D1L1O1S2 DOF/240529 REG/HSXXXX SEL/FKCH CODE/123456 PER/C
 RMK/TCAS)

(DEP-ABC123/A4414-ADEP0650-ADES-DOF/240529)

(ARR-ABC123/A4414-ADEP0655-ADES0750)

ATS Message: Limitation

- It is difficult to change
 - Requires ICAO process
- Some extra information are not machine-to-machine readable.
- In AFTN, a message is limited to 4,000 characters
- Identifying the flight related to a message needs the combination of
 - aircraft identification
 - departure aerodrome
 - destination aerodrome
 - date of flight
 - and estimated off-block time (EOBT)

FIXM: Overview

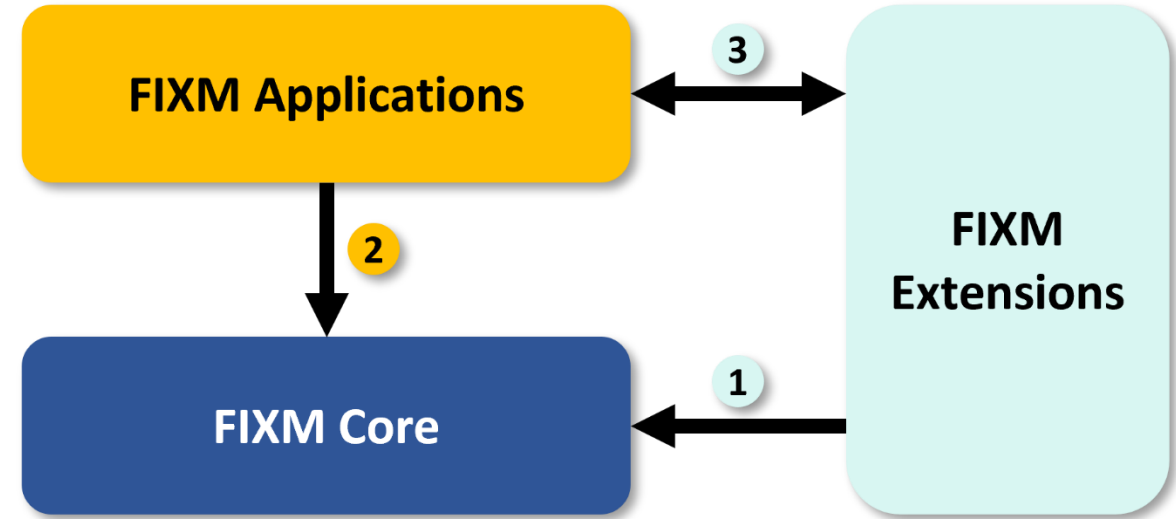

- Stands for Flight Information Exchange Model
- Globally standard exchange model for capturing Flight and Flow information
- Uses the eXtensible Markup Language (XML) standard
- The FIXM Change Control Board (CCB) provides change management
- Current Version: FIXM 4.3.0

FIXM: Component

The main FIXM Components are

- FIXM Core provides globally harmonized flight data structures.
- FIXM Application provides messaging related data structures and reuse and restrict relevant subsets of the FIXM Core (2) and FIXM Extension structure (3).
- FIXM Extension provides additional flight data structures exchanged locally and regionally and used to supplement FIXM Core (1) and FIXM Application (2).

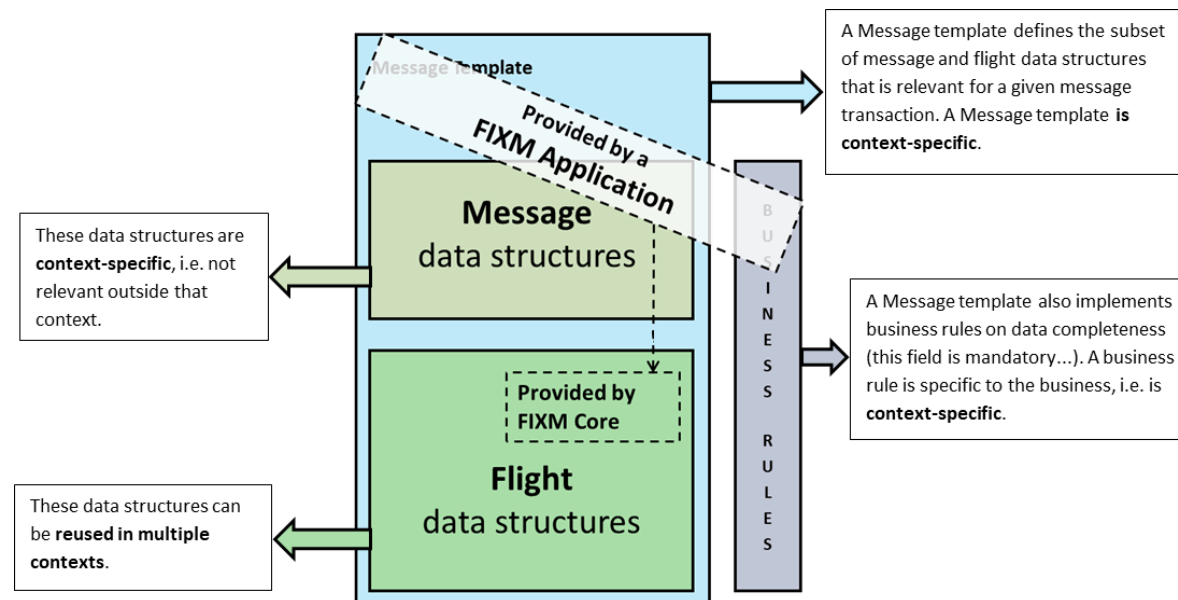

- Globally harmonized flight data structures that can be exchanged in various contexts

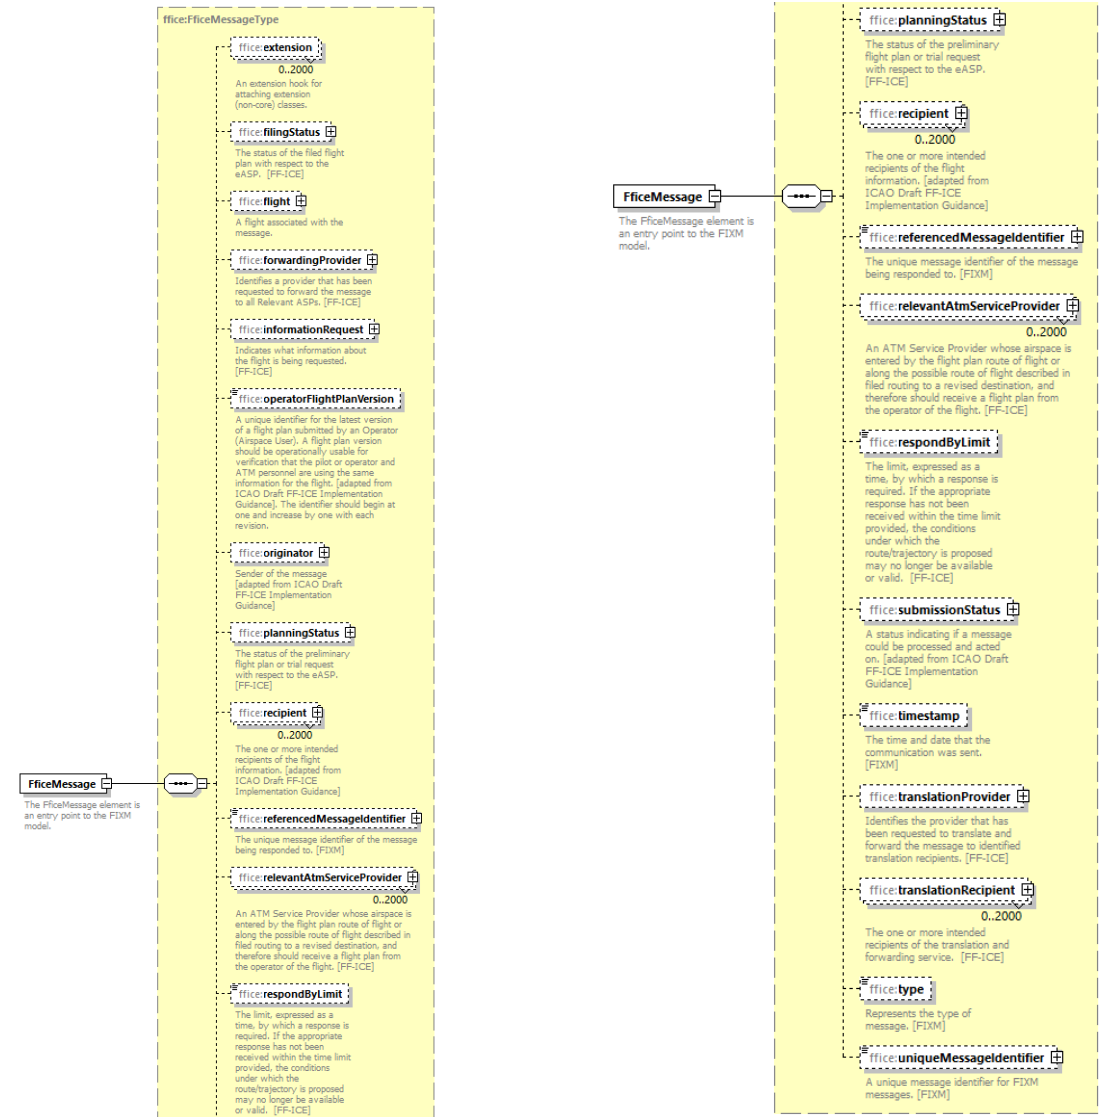

FIXM: FIXM Application

- Addresses the use of FIXM Core in a given context
- Provides context-specific message data structures and message templates
- Currently, there are 2 FIXM Applications
 - Basic Message
 - Provides basic messaging support for FIXM
 - FF-ICE Message
 - Provides support FF-ICE message transactions

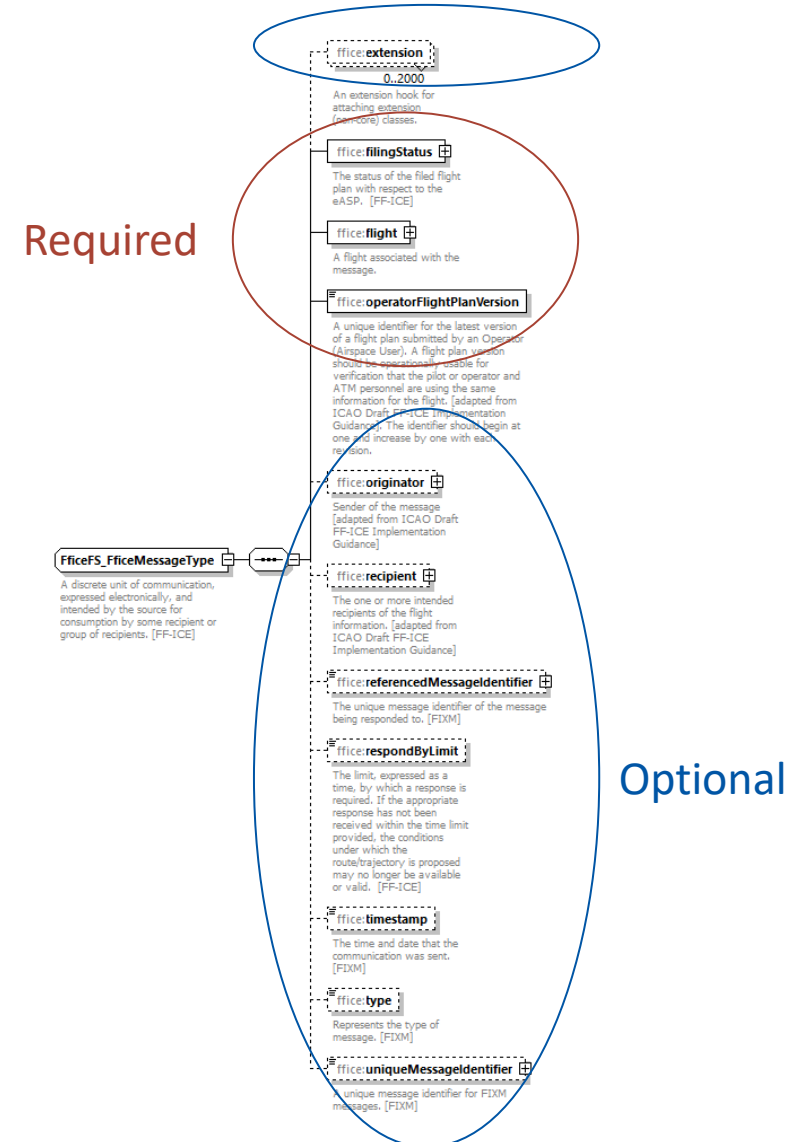

FIXM: FF-ICE Message

- Encapsulates FIXM Core within the FF-ICE Message
- Includes ALL fields required in all FF-ICE/R1 Services

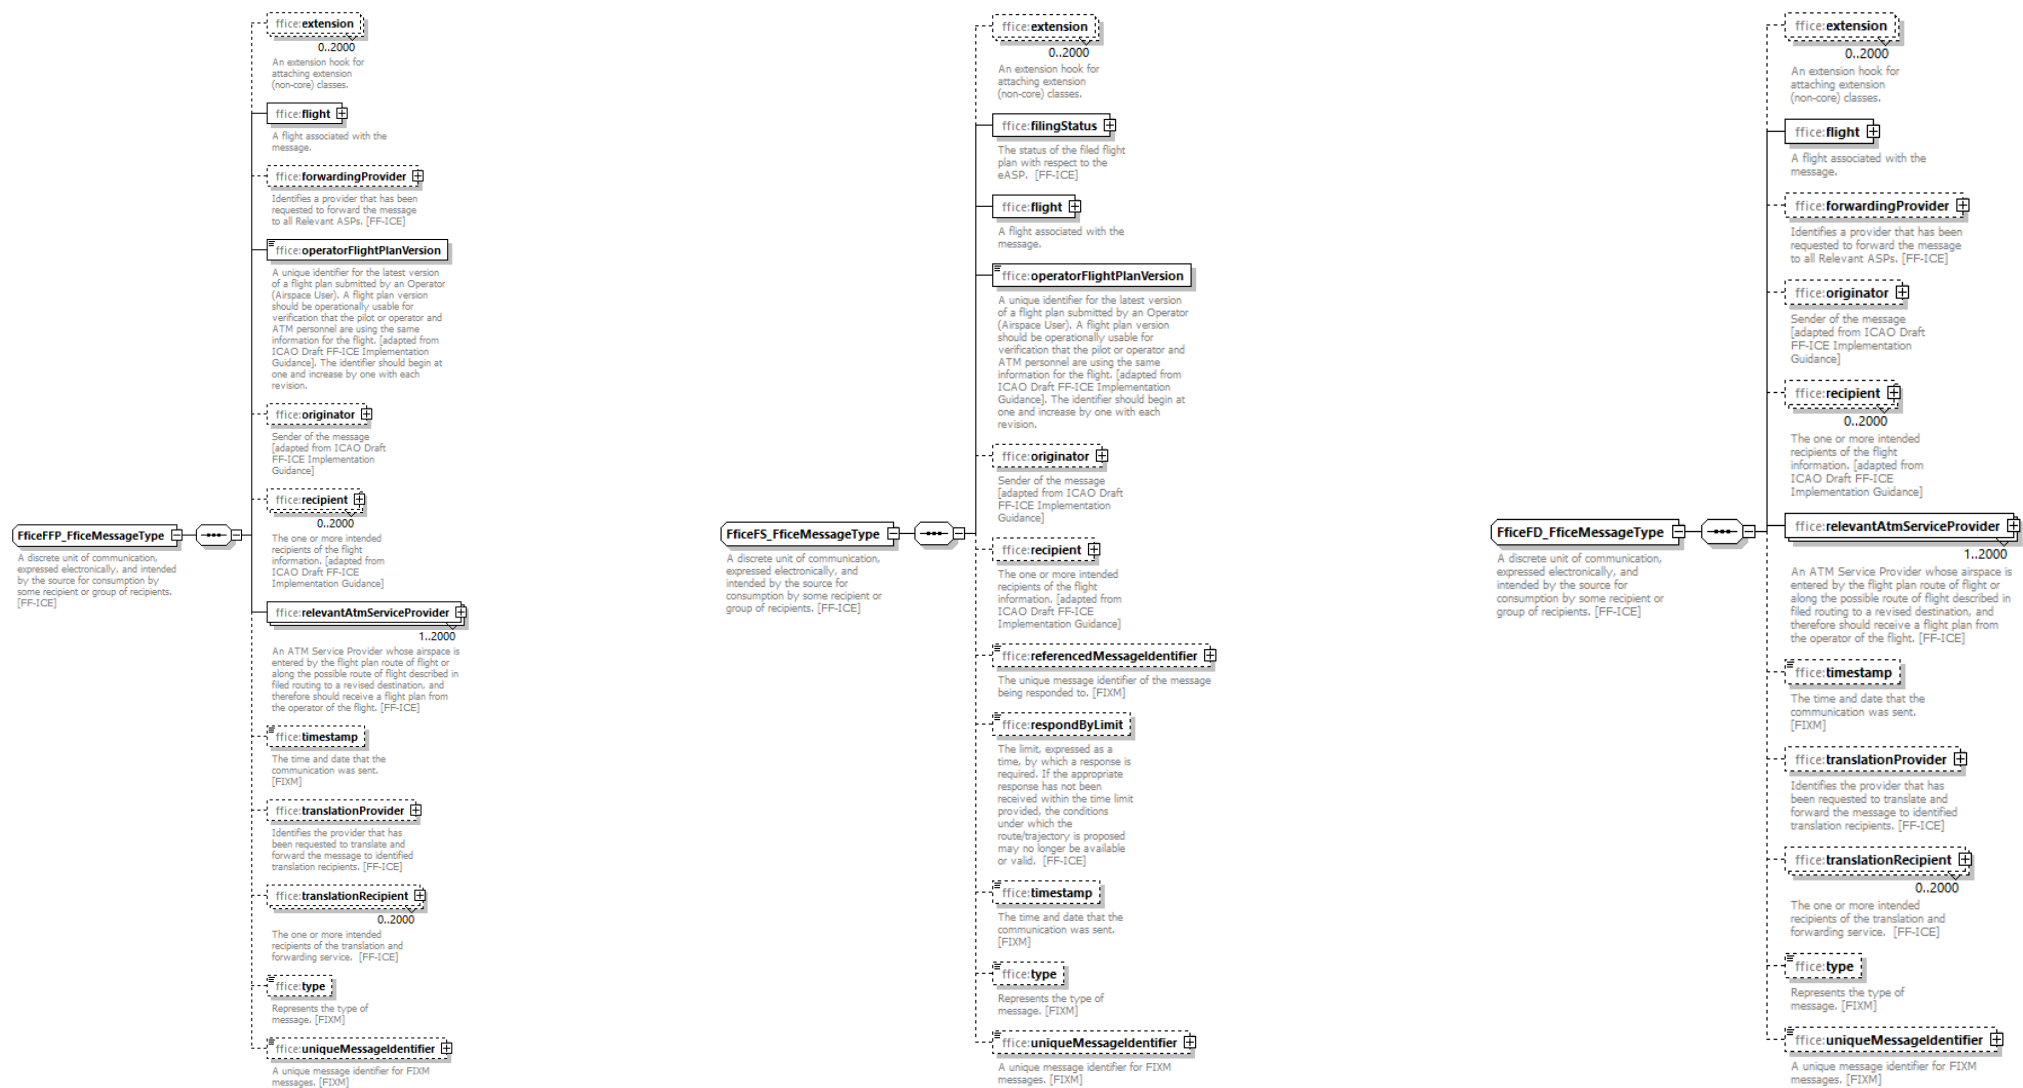

FIXM: FF-ICE Message Template

- The representations of the individual FF-ICE messages those are exchanged by the FF-ICE Services
- e.g. FF-ICE Filing Service uses 3 message templates:
 - FficeFFP_FficeMessageType (Filed Flight Plan)
 - FficeSR_FficeMessageType (Submission Response)
 - FficeFS_FficeMessageType (Filing Status)
- Each FF-ICE Message Template requires different elements
 - Also requires different FIXM Core elements
 - e.g. Filed Flight Plan requires Aircraft element but Filing Status does not require it

FIXM: FF-ICE Message Template - Example

FIXM: Extension

- An extension may supplement FIXM Core or FIXM Application by defining additional data structures exchanged locally or regionally
- A Community can create an Extension used in the community by following guidance in fixm.aero website
- In APAC region, there are 2 extensions, FIXM version 4.1 and 4.2 APAC Extension, targeting ATFM and A-CDM requirements
- Note: Processing a FIXM message with unknown extensions requires consumers to remove those extensions before process it.

    <fb:extension calculatedTakeOffTime="2024-05-29T08:53:00Z"
      xsi:type="apac:ApacDepartureType"/>
    <fx:aerodrome xsi:type="fb:IcaoAerodromeReferenceType"
      locationIndicator="VTBS"/>
  </fx:departure>
  <fx:flightIdentification aircraftIdentification="CPA770X"/>
  <fx:gufi codeSpace="urn:uuid">a03028e0-a7d1-4d6c-9d04-5bcb46666f0d</fx:gufi>
</fx:Flight>
```

FIXM: GUFi

- GUFi is Globally Unique Flight Identifier.
- GUFi is intended to provide a unique reference to a specific flight and to distinguish between similar flights.
- In FIXM 4.3, a GUFi consists of a UUID version 4, a GUFi originator namespace and a creation timestamp.
 - In FIXM 4.2 and earlier version, a GUFi consists of only a UUID version 4.
- It is generated and allocated by the operator or the designated representative.
- In mix-mode environment, it is recommended that GUFi should be used as an additional key field to identify a flight.

Generated by Google Gemini

FIXM: Benefit

- Machine-to-Machine readable
 - Developers can choose any XML parser tools to get information from a FIXM
 - Basic validation could be done by XML tools
- More Information
 - Flight Constraint
 - 4D Trajectory
- Extensibility
 - Communities can develop their own Extensions
 - Widely used Extensions could be included in FIXM Core easier via FIXM CCB

Transition: Mapping of ATS Fields to FIXM

- Mapping of ATS fields to FIXM provided in the [fixm.aero](https://docs.fixm.aero/#/ats-message-to-fixm-mapping/mapping-of-ats-fields-to-fixm) website

The screenshot shows a web browser window with the URL `docs.fixm.aero/#/ats-message-to-fixm-mapping/mapping-of-ats-fields-to-fixm`. The page content is as follows:

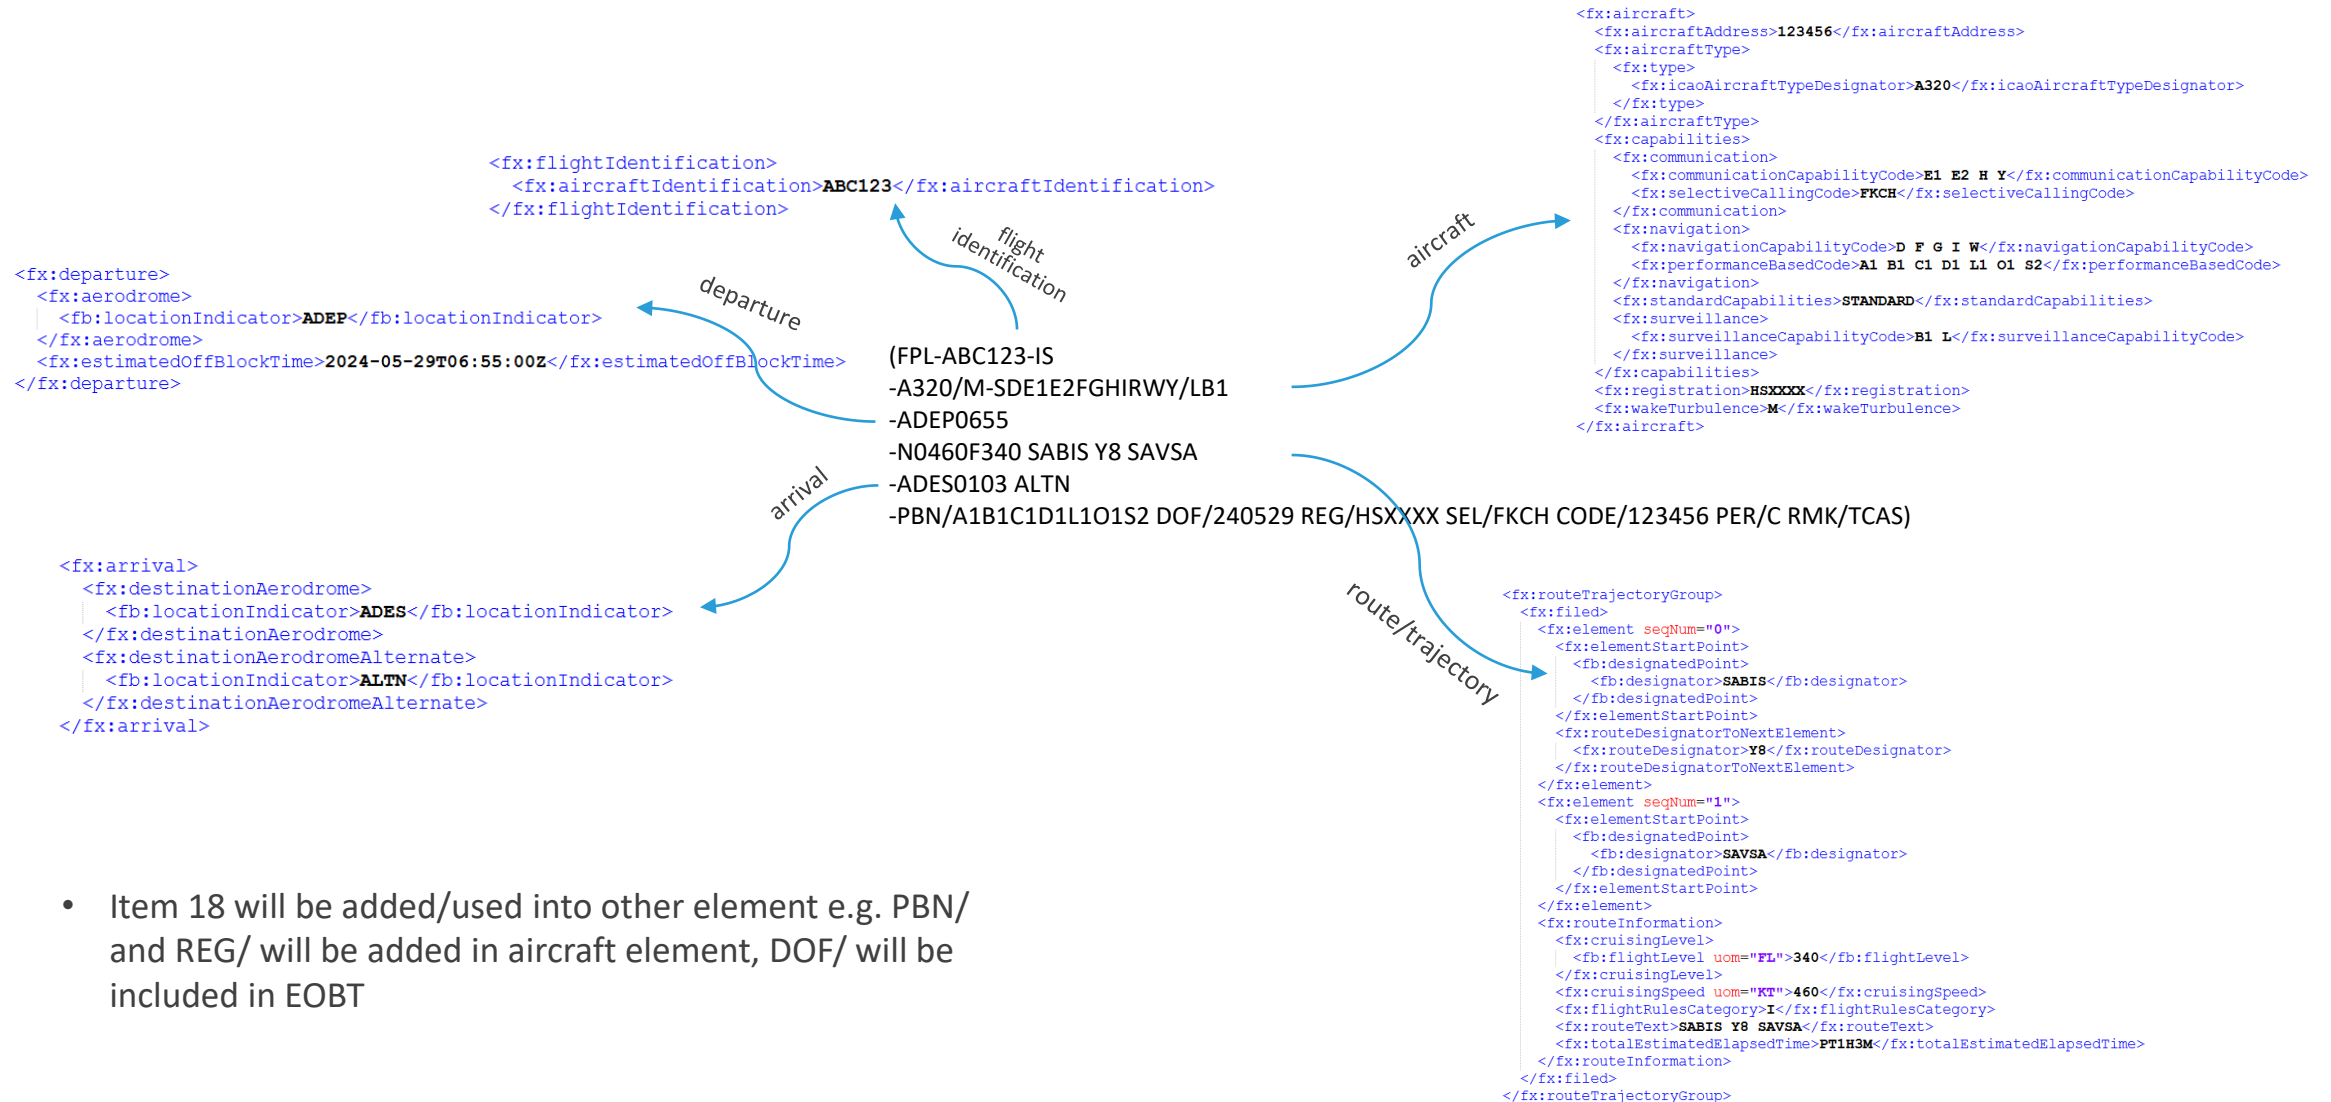

| ICAO 4444 Field | Package | Class | Path from Flight |
|-----------------|-------------------|-------------------------------------|--|
| 10a | Flight.Capability | StandardCapabilitiesIndicator | <code>aircraft.capabilities.standardCapabilities</code> |
| | | CommunicationCapabilityCode | <code>aircraft.capabilities.communication.communicationCapabilityCode</code> |
| | | DatalinkCommunicationCapabilityCode | <code>aircraft.capabilities.communication.datalinkCommunicationCapabilityCode</code> |
| | | NavigationCapabilityCode | <code>aircraft.capabilities.navigation.navigationCapabilityCode</code> |
| 10b | Flight.Capability | SurveillanceCapabilityCode | <code>aircraft.capabilities.surveillance.surveillanceCapabilityCode</code> |

Field 13

| ICAO 4444 Field | Package | Class | Path from Flight |
|-----------------|----------------------------|-------------------|---|
| 13a | Base.AeronauticalReference | LocationIndicator | <code>[13a≠AFIL ∧ 13a≠ZZZZ] departure.departureAerodrome.locationIndicator</code> |
| | | Flight.Departure | <code>[13a=AFIL] departure.airfileIndicator = AIRFILE</code> |
| 13b | Base.Types | DateTimeUtc | <code>[13a≠AFIL ∧ message∈{FPL,ARR,CHG,CNL,DLA,RQS,RQP}] departure.estimatedOffBlockTime</code> |
| | | | <code>[13a≠AFIL ∧ message∈{ALR,DEP,SPL}] departure.actualTimeOfDeparture.time</code> |
| | | | <code>[13a=AFIL] departure.estimatedRouteStartTime</code> |

Transition: Mapping of ATS Fields to FIXM - Example

15

Transition: Translating between ATS Messages and FF-ICE Messages

- There is no direct translation between ATS Message and FF-ICE Message.
- The table only shows close relevant messages.

| ATS Message | FF-ICE Template |
|-------------|-------------------------|
| | Preliminary Flight Plan |
| | Planning Status |
| | Submission Response |
| FPL | Filed Flight Plan |
| | Filing Status |
| DEP | Flight Departure |
| ARR | Flight Arrival |
| CHG | Flight Plan Update |
| DLA | Flight Plan Update |
| CNL | Flight Cancellation |
| RQP, RQS | Flight Data Request |
| SPL | Flight Data Response |

Thank You
