**INSAT 3DR Sounder derived Wind Index and
Dry Microburst Index role in aviation**
**Information Paper Asia and Pacific (APAC) Thirteenth
Meeting of the Meteorological Requirements Working
Group (MET/R WG/13) Bangkok, Thailand, 22 to 26 April
2024**

Presented by Dr. Neeti Singh,

**भारत मौसम विज्ञान विभाग
INDIA METEOROLOGICAL DEPARTMENT**

Introduction

- The wind index(WI) and Dry microburst index(DMI) are one of the most valuable parameters and show significant changeable and intermittent over a range of timescales since it is weather-dependent.
- Therefore, accurate WI and DMI observation is acknowledged as a vital contribution to trustworthy large-scale Thunderstorm forecasts.
- Ground based radiosonde data have been used to evaluate Infrared (IR) sounder data onboard the Indian navigation satellite (INSAT-3DR) satellite.

MMDRPS INSAT 3D/3R (Channels Imager + Sounder)

INSAT 3D/3R carries a six channel imager and 19 channel sounder.
The 6 spectral channels of INSAT-3D imager are:

Spectral Band	Wave length (μm)	Ground Resolution
VIS	0.55 – 0.75	1km
SWIR	1.55 – 1.70	1 km
MIR	3.80 – 4.00	1 km
WV	6.50 – 7.10	8 km
TIR-1	10.3 – 11.3	4 km
TIR-2	11.5 – 12.5	4 km

Literature Survey

- ❖ **WINDEX is based on studies of observed and modeled microbursts and is designed to help forecast the microburst wind gust potential (McCann 1994).**
- ❖ Their sudden development, vertical growth, and sudden downpours over a small area depend upon so many other processes that occur in the atmosphere.**(Federico et al 2020)**
- ❖ WINDEX is more sensitive to the low-level temperature lapse rate and it is a measure of downdraft instability making WINDEX a better local microburst potential index than other stability indices such as the Lifted Index (LI) or K-Index (KI)., **Pryor et al. (2004).**

Algorithm

$$WI = 5[H_M R_Q (G^2 - 30 + Q_L - 2Q_M)]^{0.5}$$

Convective Wind Gust Magnitude Corresponding to WMSI Values	
WI	Wind Gusts(KT)
<10	Convection Microburst Unlikely
10-49	<35
49-79	35-49
>79	>50

Wind Index Mechanism	
H_M	Melting Levels (height in kilometres above ground)
G	lapse rate (degrees Celsius per kilometre)
Q_L	The Mixing Ratio (1 km above the surface)
Q_M	The mixing ratio at the melting level.
RQ	$Q_L/12$

The Lapse Rate is the rate at which temperature changes with height in the Atmosphere.

$$H_m = y = mx + c$$

T1—Surface Temp, T2 –Change in temp

H1- Surface Height, H2-change in height

Lapse rate-- $T2 - T1 / H2 - H1$

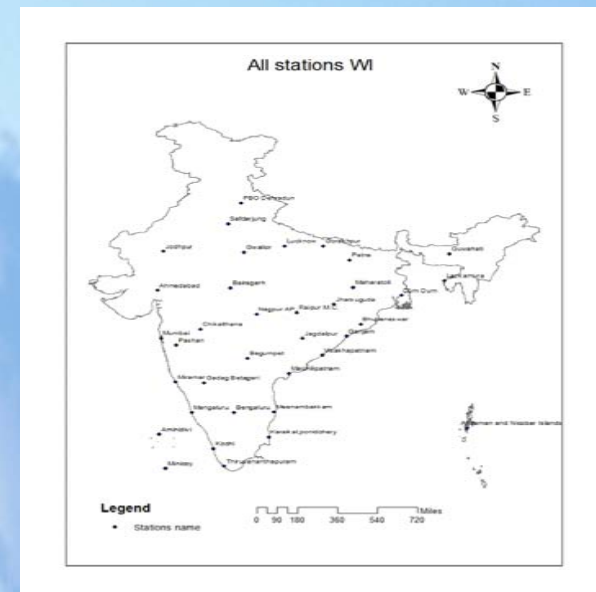

Validation of WI Radiosonde Vs. INSAT 3DR

- ❖ Level 2B (L2B) products of INSAT 3D/3DR from 2020 to 2022 are collected and correlated with Radiosonde observations.
- ❖ This remote-sensing information is associated with errors and needs to be validated.
- ❖ <http://weather.uwyo.edu/upperair/sounding.html>) Radiosonde data was collected and Wind Index was calculated.

Result Discussion

- ❖ Validation results show **Radiosonde WINDEX is overestimated compared to INSAT 3DR WINDEX.**
- ❖ **Windex is always 3-4 times more than Wind speed.**
- ❖ **Thunderstorm case analysis is done and it shows before 3-4h of thunderstorm WINDEX value goes higher side compared to normal conditions.**
- ❖ It shows a good correlation between Windex and Wind Gust.
- ❖ The forecaster now has one chart that can be monitored for the potential of wet microburst events and the associated wind gust maxima.
- ❖ Small aircraft specially helicopter operation this can be a one of the useful tool, few case analysis done on helicopter suspension and find out satisfactory result.

Result Discussion

- ❖ The high value of WINDEX supports the high vertical convective development and can cause more damage over the area.
- ❖ At the same time if we have high values of horizontal wind speed measured with an anemometer then the moisture can advect over a large area and it can affect more population over the area.
- ❖ The lapse rate between the surface and the melting level is the most important atmospheric variable in the WINDEX, Low WINDEX values result from the low-level lapse rates' relative stability.

Conclusion

- ❖ This allows the forecaster to monitor how changes in the surface parameters affect the WINDEX gust potential value.
- ❖ This work emphasizes the Wind Index accuracy for helicopter operation.
- ❖ However, wind index information is derived by satellite but always missing by Radiosonde.
- ❖ The proposed method is applied to the estimating Radiosonde wind index.
