Addressing GNSS Radio Frequency Interference (RFI) in Malaysia: Challenges, Impact, and Mitigation Strategies

Mohd Fitri Bin Ishak

Deputy Director
Civil Aviation Authority of Malaysia

Overview

01

Introduction GNSS RFI Reporting Platform in Malaysia

- Civil Aviation Reporting Systems (CAReS);
- Other reporting channels

03

Mitigation Efforts

- National Monitoring System;
- Enhanced surveillance and navigation

04

Identified Key Challenges

Reported GNSS RFI

Affected locations

Trends

05

Future Recommendation

06

Conclusion

01 Introduction

Global Navigation Satellite System (GNSS) Radio Frequency Interference (RFI)

- The **Global Navigation Satellite System** (GNSS) support **precise** navigation;
- Key challenge: RFI disruptions degrade navigation and operations;
- Study focus: GNSS RFI reports (2023 Q1 2025) show rising incidents;
 and
- Mitigation strategies in Malaysia: GNSS NMS, enhanced surveillance capability and alternative navigation aids usage

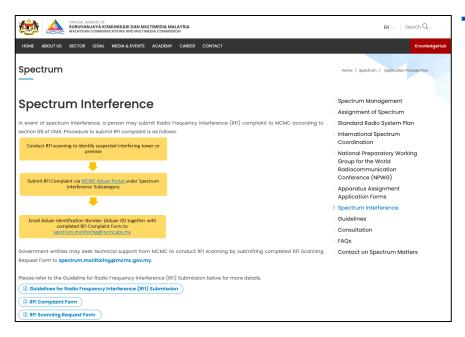

GNSS RFI Reporting Platform in Malaysia

Civil Aviation Reporting System (CAReS)

- In **April 2023**, CAAM launched <u>CAReS</u>, a <u>reporting platform</u> to <u>promote a strong reporting culture</u> within Malaysia's aviation sector.
- The regulatory division of CAAM is responsible for overseeing CAReS;
- CAReS supports two (2) types of reporting:
 - Mandatory Occurrence Report (MOR): Compulsory reporting for significant safety-related occurrences; and
 - Voluntary Occurrence Report (VOR): Allows stakeholders to voluntarily report safety-related concerns.

https://www.caam.gov.my/wp-content/uploads/2023/03/AI-04_2023_-CAReS.pdf

Other Reporting Channels

Malaysian Communication and Multimedia Commission (MCMC)

MCMC is the agency responsible for investigating harmful cases of radio frequency interference (RFI) in Malaysia.

https://www.mcmc.gov.my/en/spectrum/spectrum-interference

02

Reported GNSS RFI Incidents

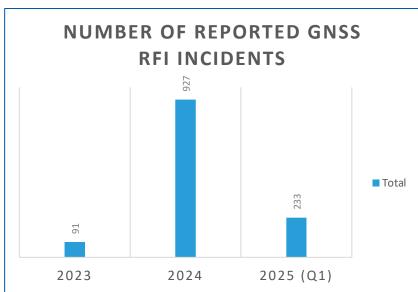

on CAReS

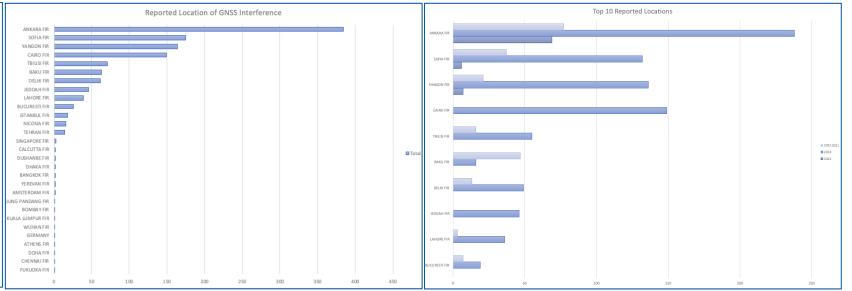

- Analysis of data from CAReS
- Affected Locations and Hotspots
- Affected Flight Phases

CAO

Reported GNSS RFI Incident Trends (2023 – 2025)

from CAReS platform

Total number of reported GNSS RFI incidents on CAReS

The reported affected locations and hotspots from CAReS

Top 10 Affected Locations

Reported GNSS RFI Incident Trends (2023 – 2025)

Key trends from CAReS reports:

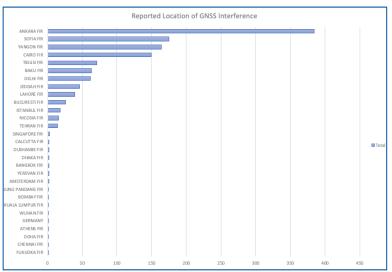

| No | Year | Number of GNSS RFI Incidents | Remarks |
|----|------|------------------------------|--|
| 1. | 2023 | 91 | GNSS RFI incidents |
| 2. | 2024 | 927 | A substantial increase of GNSS RFI incidents |
| 3. | 2025 | 233 | Only Q1 on GNSS RFI incidents |

- low number of reports in 2023 may be attributed to the initial phase of CAReS;
- the **increase** in reported incidents **in 2024 and 2025** is attributed to **better reporting mechanisms** and **stakeholder engagement sessions**.
- there is likely underreporting of in-flight GNSS RFI incidents due to the lack of real-time pilot reporting;
- if a pilot reports an interference via radio VHF, ATC is expected to document and file a report on the CAReS platform.
- No reports on GNSS RFI from ATC
- the primary challenge in mitigating GNSS RFI is the delayed reporting process;

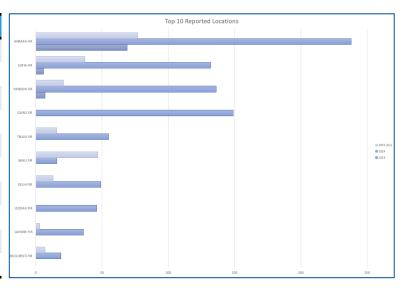

Reported GNSS RFI Incident Trends (2023 – 2025)

Affected Locations and Hotspots

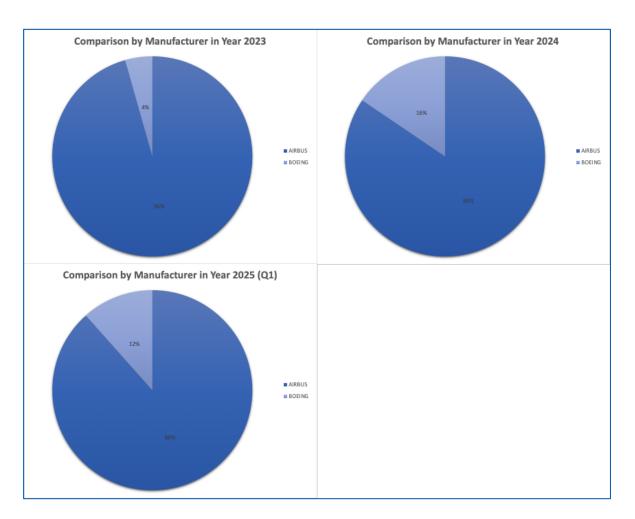

| No | Location | Number of GNSS RFI Incidents |
|-----|---------------|------------------------------|
| 1. | ANKARA FIR | 384 |
| 2. | SOFIA FIR | 175 |
| 3. | YANGON FIR | 164 |
| 4. | CAIRO FIR | 149 |
| 5. | TBLISI FIR | 71 |
| 6. | BAKU FIR | 63 |
| 7. | DELHI FIR | 62 |
| 8. | JEDDAH FIR | 46 |
| 9. | LAHORE FIR | 39 |
| 10. | BUCURESTI FIR | 26 |

- The **highest number of incidents** reported in **ANKARA, SOFIA** and **YANGON FIR**.
- No reported incident in Cairo FIR after 2024

Reported GNSS RFI Incident Trends (2023 – 2025)

Comparison between two Aircraft Manufacturers

• In general, Airbus (86%) more affected than Boeing (14%)

Reported GNSS RFI Incident Trends (2023 – 2025)

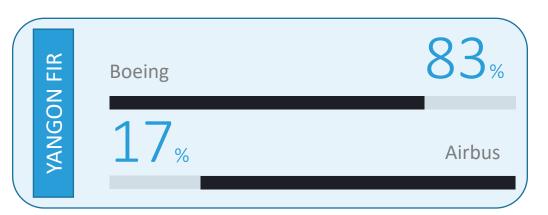

Comparison between two Manufacturers over Top Three Affected Locations

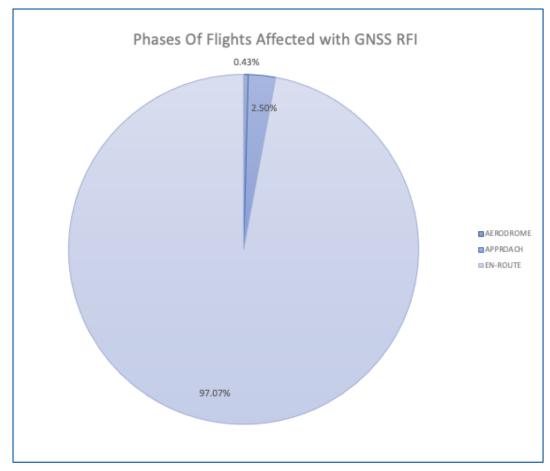

However, among the top three affected locations, **Boeing** (83%) is more affected than **Airbus** (17%) in **Yangon FIR**.

To validate this hypothesis, further analysis and insight from aviation analysts or experts would be beneficial.

Reported GNSS RFI Incident Trends (2023 – 2025)

Affected Flight Phases

| No | Phase of Flight | Number of GNSS RFI Incidents |
|----|-----------------|------------------------------|
| 1. | En-route | 1126 |
| 2. | Approach | 29 |
| 3. | Aerodrome | 5 |

• The GNSS RFI primarily affects aircraft at cruising altitudes, potentially disrupting navigation and requiring alternative solutions;

03

Mitigation Efforts in Malaysia

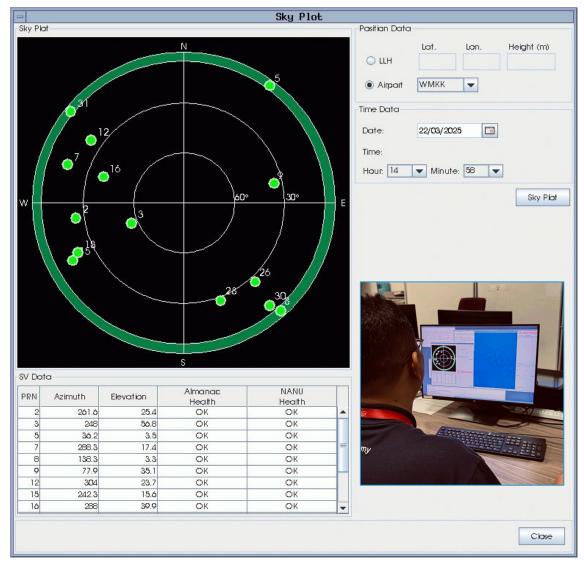

- GNSS National Monitoring Systems (NMS)
- Enhanced Surveillance Capability
- Maintaining Ground-Navigation Aids

GNSS National Monitoring System (NMS)

- Detects RFI in real-time;
- Generate automated NOTAM proposals for GNSS disruptions;
- Integrates ADS-B & radar for enhanced surveillance

- The GNSS NMS is structured as follows:
 - National Monitoring Centre (NMC);
 - Two (2) Local Monitoring Stations (LMS)
 (Penang and KL International Airport);
 - Interference and Performance Monitoring.

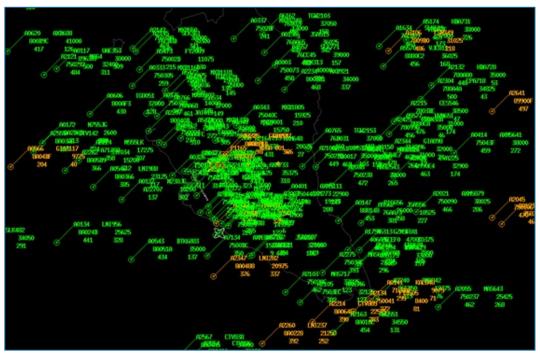

Enhanced Surveillance Capabilities (ADS-B with GNSS Receiver)

- ADS-B system with ADS-B Ground Data Processing (A-GDP) system.
- The A-GDP has advanced GNSS verification capabilities;.
- The system includes:
 - dual transceiver ADS-B units operating at 1030/1090 MHz;
 - work as Multi-lateration (MLAT);
 - connected with dual GNSS receiver unit; and
 - Time Difference of Arrival (TDOA) techniques to validate ADS-B target positions;

Green means Validated ADS-B positional information

Enhanced Surveillance Capabilities

- validated positional information (green indicates validated ADS-B position);
- improving the confidence of ATC to utilise the information for providing Air Traffic Services;
- robust surveillance coverage (PSR/SSR Mode-S and ADS-B systems)
- utilise radar vectoring techniques in the event of GNSS RFI.

Maintaining Alternative Navigation Capabilities

- Continue expanding PBN airways and IFP to enhance ATC and Airline's efficiency;
- with overlapping surveillance & NMS to ensure rapid GNSS RFI response;
- with Backup navigation (DVOR/DME, ILS) to support safe recovery during GNSS outages;
- to ensure operational continuity in case of GNSS disruptions

04

Identified Key Challenges Key challenges related to GNSS RFI:

- Rising GNSS RFI incidents;
- Lack of real-time mitigation mechanisms & reliance on outdated reports;
- Operational and safety risks GNSS-based navigation overdependence;
- Limited awareness of existing reporting mechanisms (CAReS, MCMC).

05

Future Plan and Recommendation

- Strengthen real-time reporting & monitoring via ATC-Pilot integration;
- Ensure alternative navigation solutions (DME/DME, VOR/DME, radar vectoring);
- Invest in mitigation technologies, including adaptive GNSS interference monitoring, TDOA surveillance systems
- continuous stakeholder engagement initiatives to enhance cooperation and awareness on GNSS RFI;

GNSS RFI remains a growing challenge to aviation safety and efficiency; 06 Despite mitigation efforts, real-time reporting gaps persist; **Conclusion** Continuous monitoring, stakeholder collaboration, and technology **investment** are key to resilience; Future efforts should focus on proactive detection, real-time reporting, and integrated response strategies; **Seamless coordination** between ATC, pilots and equipment integration such as GNSS NMS is essential to strengthening air navigation system resilience;
