# Lessons Learned

---

Understand of:

- What constitutes in a public health corridor;
- The structure of the health corridor;
- A multi-level approach;
- General principles of risk management applied to air transport in emergency situations.

# Lessons Learned

---

1. The need for interaction between civil aviation and the public health authorities is highly important. Joint procedures at "points of entry" – airports are needed.
2. Update of the National Facilitation Program is needed.
3. The need to develop a roadmap for the implementation of a Public Health Corridor between States.
4. Review of airport emergency plans is needed.
5. Staff training on applying international and national regulations in public health matters in aviation is needed. The involvement and interaction of all stakeholders are important, both at the leadership (decision making) level and at the level of implementation of rules and their enforcement.
6. Exchange of experience between states on public health issues in civil aviation is needed.
