Table of Contents

RECORD OF REVISIONS

Rev. Number	Effective Date	Details
0	August 2023	*Approved by EASPG PCG Decision 5/2 and by EASPG via correspondence*
1	December 2023	*Approved by EASPG Decision 5/6* New EUR.SPT.101 added to section 5.3.1.5, executive summary updated

Executive Summary

The EUR RASP 2023-2025, being the fourth edition of the Regional Plan, was compiled by a dedicated RASP working group being part of the EUR RESG, supported by the ICAO EUR/NAT Regional Office and by EASA.

Changes made in Volume I mainly concern:

- The operational context information, taking into consideration COVID-19 pandemic impact, current geopolitical and economic crises;

- Update of context of GASP and EPAS;

- The EUR RASP management processes, based on evolved agreed procedures and separate documents being developed as guidelines;

- Removing Chapter 3.1.0 on "Safe return to operations" since the management of risks stemming from the return to operations is considered an integral part of normal operating modes;

- Removing Chapter 3.3.2 on Engine/Aircraft Certification as considered type certification specific and noting this is also phased out in EPAS;

- Updating Chapters 3.1.4 "Impact of security on safety" and 3.1.5 "Civil-military coordination and cooperation;"

- Updating the safety intelligence data throughout the report based on ICAO EUR Annual Safety Report for 2021 and EASA Annual Safety Review for 2022; and

- Removal from Chapter 4 of EUR.SPI.2.1.05, "Number of EUR States maintaining a safety oversight index greater than 1 in all categories" to align with the changes made in the GASP.

Volume II includes 2 (two) new actions as follows:

- EUR.SPT.0099   Application of selected ISO QMS requirements for management systems of selected aviation service providers

- EUR.SPT.0100   Establishment of harmonised safety data collection and processing systems (SDCPS) at State level

1 (one) action was removed from Volume II:

- EUR.RMT.0096 Digital License for Aviation Pilots

Also two previously independent chapters in Volume II were combined to represent the common chapter 5.9 on Aerodromes and ground handling.

Existing actions were reviewed and their timelines extended where required to reflect progress with delivering on European Plan for Aviation Safety (EPAS) 2022-2026 actions and EPAS Vol. II 2023 edition deliverables so that EUR RASP actions can build upon the available EPAS deliverables (including European/EASA rulemaking deliverables). In addition all actions with completion targets ending by Q2 of 2023 were extended by one year

During the discussions held at the fifth meeting of the EASPG Programme Coordinating Group (EASPG PCG/05) it was agreed to align the EUR RASP update cycle with the Global Aviation Safety Plan (GASP) update cycle every 3 years starting EUR RASP 2023-2025. Consequently, the Regional Expert Safety Group (EASPG RESG) have requested flexibility to review EUR RASP within agreed reference period and amend the existing version when justified. In particular, during the fifth meeting of EASPG, RESG requested to add new safety to promote awareness of the risks associated with the carriage of misdeclared/undeclared lithium batteries in

the cargo compartment and to encourage the proactive implementation of robust controls. Based on EASPG Decision 5/6 current revision of EUR RASP 2023-2025 is appended to include EUR.SPT.101.

Volume I

1. Introduction

1.1 Background, objectives and principles

The main objective of this European Regional Aviation Safety Plan (hereafter EUR RASP) is to create a common focus on regional aviation safety issues as a continuation of the European work to improve aviation safety and to comply with ICAO standards. This approach complements the existing system of developing safety regulations, complying with them and investigating accidents and serious incidents when they occur.

The EUR RASP adds a proactive element to the current system by closing the safety management cycle and connecting the safety issues at regional level with the action plans and initiatives launched to mitigate the underlying risks.

The EUR RASP establishes the first layer of priorities which is further complemented at national level by national aviation safety plans (NASPs), framed under the State Safety Programmes. It builds a network for action, thus coordination and close collaboration are key to keeping it up to date and effective.

Since 2017, the ICAO Regional Office for the EUR region and EASA have been working together to develop a Regional Aviation Safety Plan (RASP) based on the European Plan for Aviation Safety (EPAS), thus allowing all States that are part of the EUR region to benefit from this approach. This leverages the European Safety Risk Management (SRM) process for the entire EUR region.

The first EUR RASP edition covering the period 2019-2023 was issued on 31 January 2019 following endorsement at the combined meeting of the coordination groups of the European Air Navigation Planning Group (EANPG) and Regional Aviation Safety Group – EUR region (RASG-EUR) of ICAO. The second EUR RASP edition, covering the period 2020-2022, was adopted in June 2020. The third EUR RASP edition, covering period 2022-2024 was adopted by European Aviation System Planning Group (EASPG) during its third meeting in December 2021. The forth EUR RASP edition, covering period 2023-2025, was adopted by European Aviation System Planning Group (EASPG) via correspondence during remote consultation period in June 2023.

The EUR RASP is updated on a yearly basis, in order to maintain alignment with GASP and EPAS. There were no significant changes were made to the strategic priorities indicated in GASP 2023-2025 and EPAS 2023-2025, accordingly, the strategic priorities in this EUR RASP edition remain stable.

This edition was prepared by the ICAO EUR Regional Expert Safety Group (RESG) and dedicated Regional Aviation Safety Plan Working Group reporting to RESG. These working groups were created within the European Aviation System Planning Group (EASPG) structure to support the development and implementation of the EUR RASP, including safety enhancement initiatives and activities, in line with the objectives of the EASPG.

From 2022 onwards the EUR RASP planning activity is followed up by a reporting phase, during which progress on action implementation and more generally, progress with SSP and NASP implementation, is assessed by means of a dedicated monitoring survey. The data and information gathered will feed not only subsequent planning cycles, but also the EUR RASP implementation reports and EUR annual safety reports produced by the ICAO EUR/NAT Regional Office.

1.2 The Global Aviation Safety Plan (GASP)

The EUR-RASP supports the objectives and priorities of GASP 2023-2025. The purpose of GASP is to continually reduce fatalities, and the risk of fatalities, by guiding the development of a harmonised aviation safety strategy. A safe, resilient and sustainable aviation system contributes to the economic development of States and their industries. The GASP promotes the effective implementation of a State safety programme, including a State's safety oversight system, a risk-based approach to managing safety as well as a coordinated approach to collaboration between States, regions (that is, a group of States and/or entities working together to enhance safety within a geographic area) and industry. It provides a framework in which regional and national aviation safety plans (RASP and NASP) are developed and implemented.

The vision of the GASP is to achieve and maintain the aspirational safety goal of zero fatalities in commercial operations by 2030 and beyond, which is consistent with the United Nations' 2030 Agenda for Sustainable Development. The plan's mission is to continually enhance international aviation safety performance and resilience by providing a collaborative framework for States, regions and industry. This is supported by a series of goals:

— Goal 1 is to achieve a continuous reduction of operational safety risks.
— Goal 2 calls for all States to strengthen their safety oversight capabilities.
— Goal 3 calls for the implementation of effective State safety programmes.
— Goal 4 calls for States to increase collaboration at the regional level to enhance safety.
— Goal 5 aims to expand the use of industry programmes and safety information sharing networks.
— Goal 6 focuses on the appropriate infrastructure needed to support safe operations.

Each region and each State should use the GASP to develop a RASP and NASP respectively, which includes industry participation. The RASP or NASP presents the strategic direction for the management of aviation safety at the regional or national level, for a set period and should be developed in line with the GASP's goals, targets and G-HRCs. To achieve the GASP goals and targets, authorities within the State need to provide sufficient resources and qualified technical personnel for the development and implementation of the State's NASP.

The global aviation safety roadmap serves as an action plan to assist the aviation community in achieving the GASP goals. The roadmap, previously included in the GASP, was updated and is now contained in the Global Aviation Safety Roadmap (Doc 10161).

The EUR RASP considers in particular the GASP goals to enhance the level of safety in aviation. ICAO, based on USOAP audit results, identified that States' inability to effectively oversee aviation operations remains a global safety concern. Thus, the GASP objectives call for States to put in place robust and sustainable safety oversight systems that should progressively evolve into more sophisticated means of managing safety. These objectives are aligned with ICAO Standards and Recommended Practices (SARPS) for the implementation of SSP by States and safety management systems (SMS) by service providers, they are addressed in EUR RASP in section 5.1 Safety management.

In addition to addressing systemic safety, GASP addresses global high-risk categories of occurrences, which are deemed global safety priorities. The types of occurrences considered to be G-HRCs, in alignment with the ADREP occurrence categories, were selected based on actual fatalities, high fatality risk per accident or the number of accidents and incidents. Based on results from the analysis of safety data collected globally from proactive and reactive sources of information, as well as from ICAO and other non-governmental organizations, five G-HRCs were originally identified for the 2020–2022 edition of the GASP. These same G-HRCs (listed in no particular order) are maintained as G-HRCs for the 2023–2025 edition of the GASP:

— controlled flight into terrain (CFIT);
— loss of control in-flight (LOC-I);
— mid-air collision (MAC);
— runway excursion (RE); and
— runway incursion (RI).

Accordingly, the EUR RASP 2023-2025 continues to address these high risk categories and proposes mitigation actions for the main safety issues identified for these high risk categories of occurrences.

The global operational priorities are addressed in the following sections: **5.3.1.1** Aircraft upset in flight (LOC-I), **5.3.1.2** Runway safety (covering RE and RI), **5.3.1.3** Airborne conflict (MAC) and **5.3.1.4** Terrain collision (CFIT).

1.3 The European Plan for Aviation Safety (EPAS)

1.3.1 General

The EUR RASP is built upon the experience gathered by EASA, EU and ECAC on the development and implementation of the EPAS. EPAS is a key component of the safety management system (SMS) at the European level, which is described in the European Aviation Safety Programme[1] (EASP). The regional approach complements national approaches offering a more efficient means of discharging State obligations for safety management in the EU's aviation system.

Due to specific difference in the areas of coverage for EPAS and EUR RASP, and in consideration of the legal obligations of EASA Member States with regards to the EPAS pursuant to Regulation (EU) 2018/1139 Chapter II 'Aviation Safety Management' it was agreed to maintain both documents, while ensuring that they are aligned as far as practicable and not contradicting each other.

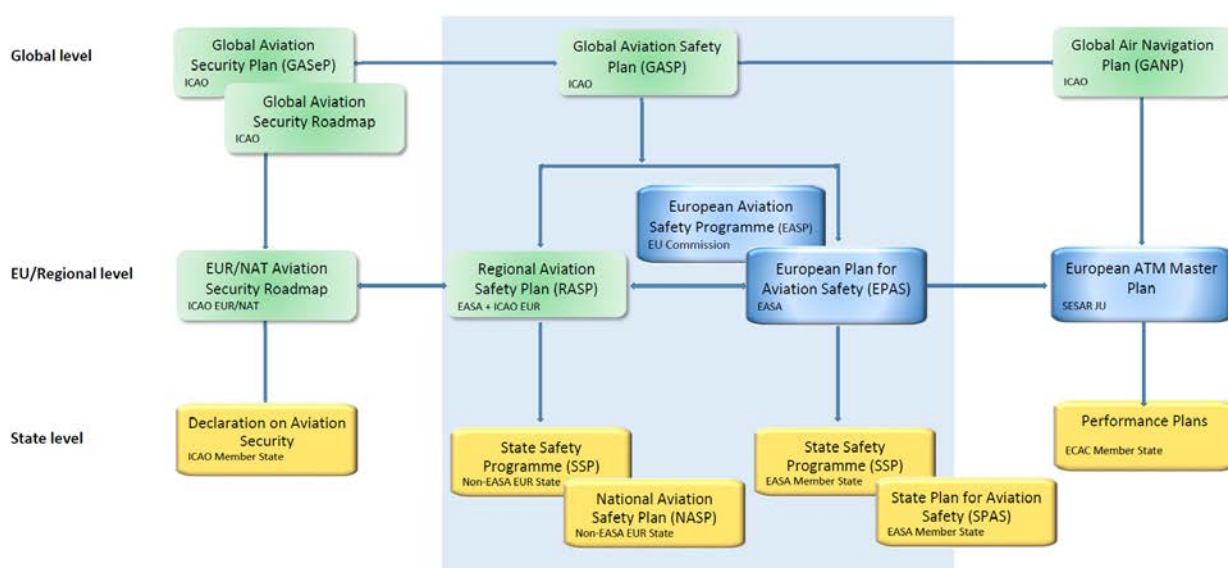

Figure 1: Relationship between the EUR-RASP and other programmes and plans

---

[1] EUR-Lex - 52022DC0529 - EN - EUR-Lex (europa.eu)

Originally, EPAS was created to support the future growth of aviation while securing a high and uniform level of safety for all Member States. This approach allows the States, the European Commission and EASA to take the necessary actions at the right time and at the right level so as to ensure safe, secure and environmental friendly implementation of new business models and deployment of new technologies.

EPAS constitutes the regional aviation safety plan for EASA Member States. It sets out the strategic priorities, describes the main risks affecting the European aviation system and defines the necessary actions to mitigate those risks to further improve aviation safety.

The EPAS comprises three distinct volumes:

- Volume I provides the executive summary, the introduction, the operational context, the strategic priorities and key risks within each operational domain..

- Volume II contains the detailed list and description of all EPAS actions.

- Volume III provides the overview of the main safety risks affecting the European aviation system and underlying safety issues, in the form of domain Safety Risk Portfolios.

As a result of the review of strategic priorities the EPAS reference period is reduced to 3 years, during which priorities and objectives (Volume I) will remain unchanged , while actions (Volume II) and safety risk portfolios (Volume III) will continue to be reviewed and updated annually.

1.3.2   EPAS 2023-2025

The 2022 EPAS planning cycle entailed a comprehensive review of EPAS Strategic Priorities against the new operational context: While the aviation industry is still recovering from the COVID-19 crisis it is exposed to the significant disruptions and economic challenges following the aggression by the Russian Federation against Ukraine (UN General Assembly Resolution A/ES-11/L.1 and ICAO Resolution A41-2 refer).

The strategic theme for the EPAS 2023-2025 is to **foster a safe, secure, sustainable and resilient aviation system, capable of coping with disruptive events of any type**. This will be achieved by building on the lessons learned from COVID-19 and major accidents, fostering safety management implementation at State and industry level, as well as promoting the establishment of an emergency/crisis management function as part of the State Safety Programmes (SSPs) and Safety Management Systems (SMS) implemented in the industry.

Availability of well-trained and competent aviation personnel is paramount to the safety and resilience of the aviation industry. In that respect 'Competence of personnel' is now included as a distinct EPAS strategic priority, to support the implementation of competency-based training and assessments (CBTAs) across domains and promote a more evidence-based, data-driven approach to aviation training and examination.

Building on risk management capabilities fostered in the aviation system through the implementation of SMS and SSP, the strategic priority 'integrated risk management' is strengthened by addressing a broader set of risks that have the potential to adversely impact aviation safety. This EPAS strategic priority, now included as 'manage risk interdependencies', aims at fostering capabilities to effectively identify and manage interdependent risks, by allowing better visibility on and enhancing the understanding of such risks to define the most effective strategy to cope with those interdependencies.

EPAS strategic priorities for operational safety are determined with due regard to the Key Risk Areas (KRAs) or feared accident outcomes the European aviation system should strive to avert. KRAs are identified through the European Safety Risk Management (SRM) process, by using the European Risk Classification scheme (ERCS). KRAs

(for example, excursion) show the areas of domain-specific risks to focus, to keep the European civil aviation system safe. KRAs are then further analysed to determine the underlying causal and contributing factors, which within the European SRM process are referred to as 'safety issues'[2]. Safety issues, not KRAs, can be risk-assessed and practically managed (mitigated). KRAs are controlled by assessing and implementing mitigating actions on the underlying safety issues. Safety issues are defined across domains (e.g. for Human Factors and Human Performance or to address the risks stemming from the COVID-19 pandemic) or for a specific operational domain and grouped in the European Safety Risk Portfolios, published with EPAS Volume III[3].

EPAS strategic priorities are also reinforced in the area of new technologies, innovative solutions and operating concepts, in order to ensure their safe integration into the aviation system and facilitate the emergence of such new technologies and solutions. Many of the technologies and innovations emerging in the aviation industry bear significant potential to further improve the level of safety, e.g. by improving the collection and analysis of operational data, ensuring improved accessibility and better quality of meteorological information, etc. At the same time new operating concepts and emerging business models, novel aircraft or propulsion systems are emerging, and their specific features may not be addressed in existing certification specifications and operational regulations. These new business models and operating concepts need to be performed in a safe and secure manner to maintain the confidence that citizens have in the air transport system.

1.4   Operational context

The EUR region, being the largest ICAO region, encompasses a wide variety of States, with notable differences in terms of aviation industry, traffic volumes and types of aviation activity. Existing historical disputes, different political points of view multiplied by the effect of current pandemic impose safety and efficiency challenges within the EUR region.

While EASA States within the region are subject to a common regulatory framework addressing a vast majority of aspects in civil aviation and are regularly monitored for the uniform application of the Community law, there are differences in applicable aviation regulations in the remaining States, which may be the result of different speeds or different means in the transposition of ICAO SARPs.

USOAP CMA results show an average Effective Implementation (EI) score for States in the EUR Region of 77%. USOAP CMA results also show that 62% of the States in the EUR Region have already achieved the target of 75% EI by 2022, as outlined in the 2023-2025 edition of the Global Aviation Safety Plan (GASP).

EUR States have on average implemented 82.64% of the SSP foundational Protocol Questions of the USOAP CMA, identified as fundamentals and considered as prerequisites for sustainable implementation of the full State Safety Programme. More than half of EUR States have already developed their National Aviation Safety Plan (NASP), as encouraged by the GASP, outlining each State's strategic direction for the management of aviation safety for a set time period. NASPs demonstrate States' commitment to the implementation of activities for the improvement of safety.

There are currently 3 (three) States having operational restrictions with regards to the European Airspace in accordance with the EU Safety List. There is 1 (one) States with significant safety concerns in the AN Region-EUR.

---

[2]   Safety issues constitute safety deficiencies related to one or more hazards and are the actual manifestation of a hazard or combination of several hazards in a specific context. For example, approach path management and runway surface condition safety issues are contributing to the excursion KRA.

[3]   Further details on the European Safety Risk Management process can be found in the EASP Chapter 2 and in EPAS Volume III.

Based on 2021 data, in the EUR Region, 39 (71%) States have no air navigation deficiency classified as having implication with air navigation safety while 13 (24%) States have no air navigation deficiency against the EUR air navigation plan. As December 2021, one deficiency having a direct impact on safety and requiring immediate corrective actions was identified in the EUR region. An additional 29 deficiencies classified as having top priority requirements necessary for air navigation safety were identified, and 40 with intermediate requirements necessary for air navigation regularity and efficiency.

Based on 2021 data, the number of accidents involving scheduled commercial operations with aircraft of maximum mass of over 5700 kg and occurring in one of the 55 States in the EUR Region has increased in 2021 compared to 2020: 12 of such accidents occurred in 2021, including two fatal accidents resulting in 32 fatalities. This resulted in a regional accident rate of 2.35 accidents per million departures, up 18% from the 2020 rate of 2.00 accidents per million departures.

The vision of the Global Aviation Safety Plan (GASP) and of the EUR RASP is to achieve and maintain the goal of zero fatalities in commercial operations. Five high-risk categories of occurrence (HRCs) need to be addressed to mitigate the risk of fatalities: controlled flight into terrain (CFIT), loss of control in-flight (LOC-I), runway excursion (RE), runway incursion (RI) and mid-air collision (MAC). For States in the EUR Region, HRCs represent 17% of all accident categories for accidents involving scheduled commercial operations with aircraft of maximum mass of over 5700 kg. This is a decrease to what it was in 2020 (22%).

IATA[4] expect the industry to reach 2019 levels of traffic in 2024. The single most important factor in determining airline profitability and air traffic in general currently is still the presence or absence of travel restrictions. As the World Health Organization states that the end to the pandemic is in sight, the time to eliminate ineffective travel restrictions has surely arrived.

According to the EUROCONTROL[5] it is not expected that traffic volumes in Europe will return to pre-pandemic levels before 2026. High inflation rates, weak EURO and energy crisis and drive towards sustainability will all have an impact on travel plans of the flying public. It is expected that restrictions on Ukrainian, Russian, Belarusian and Moldovan airspaces to remain until 2025. Overall decrease of the economic situation with downward revision of the GDP forecast for 2023 due to rising inflation, dwindling growth and growing geopolitical and natural disruptions to business. Increasing energy prices and the knock-on effect on the purchasing power of consumers to affect travel demand. Cargo segment strongly impacted due to constrained operations of key cargo carriers.

While seeing some positive trends it is clear that the recovery from the CoVID-19 crisis, geopolitical crisis in Europe, weakening global and regional economy will continue putting huge financial pressure on aviation stakeholders and will require additional and cooperated efforts from all stakeholders to maintain the current level of safety and reach the GASP aspirational safety goal.

2. EUR-RASP development and structure

2.1 How EUR RASP is developed

The draft EUR RASP is prepared by a dedicated Working Group under RESG (Regional Expert Safety Group). The RESG RASP Working Group (RESG RASP WG) reports to EUR RESG on progress before presenting outcomes to the EASPG. RESG submits the final draft to EASPG for approval at the end of each planning cycle (normally in December). In order to document the standardized process of developing and maintaining EUR RASP and its relating actions, the RESG RASP WG is preparing guidelines to document the process, procedures, roles and responsibilities (further referred to EUR RASP management guidelines). Until those guidelines are published, the following general considerations apply.

The EUR RASP is reviewed and updated as needed on a yearly basis following the updates of GASP and EPAS to consider new risks and actions, progress with the implementation of existing actions, maintaining the alignment of the plans in terms of strategic priorities, key risk areas, safety issues and related mitigation actions.

The amendment process consists of four phases:

1. Development of an initial draft
2. Consultation on the initial draft
3. Comment analysis, comment disposition and preparation of the final draft
4. Approval of the final draft, final editing and publication

Detailed description of each phased would be presented in the EUR RASP management guidelines.

2.2 How EUR RASP is structured

The 2023 – 2025 EUR RASP is composed of two distinct volumes, complemented by two Appendices

- Volume I provides the introduction, describes the strategy and the EUR Safety Performance Indicators. It consists of Chapters **1** to **4**.
- Volume II contains the list of the detailed EUR RASP Safety actions. It consists of Chapter **5**, grouped by operational domains in 12 subchapters from **5.1** to **5.12**.
- Appendix A: EUR RASP Acronyms and definitions
- Appendix B: List of EUR RASP Stakeholders

Volume I

The executive summary provides the main highlights of this edition.

It is followed by the introductory chapter where the objectives of the Regional Plan as well as its relationship with the GASP and EPAS are explained.

Chapter **2** further explains the development process of the EUR RASP and the structure of the document, including how the EUR RASP actions are presented further down in the Chapter 5.

Chapter **3** describes the strategic safety priorities.

Chapter **4** contains the safety metrics and targets agreed for the EUR region, together with information on how EUR RASP implementation is monitored and how related safety performance indicators are measured.

Volume II

Chapter 5 contains all detailed EUR RASP safety actions, grouped per domain (systemic and operational) and divided into subchapters **5.1** to **5.11**,.

Within each subchapter, the following information is provided:

- rationale behind the safety issue (why it has been identified as an issue);

- what it is to be achieved (objective);

- how it is intended to monitor improvement in the future; and

- how it is intend to achieve the objective; here, the various actions contributing to mitigate the identified risk in that area are described.

EUR RASP Safety Actions:

There are two types of actions included in the EUR RASP[6]:

— **Rulemaking tasks (RMTs)**

RMTs are intended to lead to new or amended regulatory material, however the related work is usually not limited to rules drafting. Depending on the scope and issues addressed, a rulemaking project may also include implementation support activities, such as the organisation of conferences, workshops, roadshows, the creation of frequently asked questions (FAQs), etc.

An RMT may also be supported by a dedicated safety promotion task (SPT).

For EASA Member States such actions are owned by EASA. For other EUR States, all of such actions are owned by individual States or groups formed by ICAO for the purpose of establishing common regulations.

— **Safety Promotion tasks (SPTs)**

SPTs may be owned by States, Industry or other stakeholders and involve safety training, awareness/education and dissemination of safety relevant information to further engage and interact with relevant aviation stakeholders in order to positively influence or change individual behaviour with the ultimate objective of achieving predetermined aviation safety objectives. It includes the promotion of safety topics, rulemaking and awareness, communicating about safety intelligence, priorities and actions and other tasks to raise awareness with individuals, as well as organisations.

SPTs may also address systemic safety, such as, but not limited to, maintaining effective oversight capabilities, the implementation of effective SSPs and related State safety action planning, as well as operational safety issues identified in the safety risk management process, safety priorities identified in GASP or through the EASA Standardisation or ICAO USOAP processes.

SPTs can involve a wide range of deliverables that include guides, videos, text for use in websites and printed media, social media and outreach activities.

---

[6] While all EUR RASP actions are directly relevant to EUR States, the existing EPAS three-letter codes for type of action (RMT, SPT) are maintained to not lose the link with the corresponding EPAS actions. However, SPT actions in EUR RASP may also stem not only from SPT EPAS actions, but also from MST EPAS actions.

The Regional Office may further support the implementation of specific SPTs through thematic workshops, targeted implementation support actions, training sessions, etc. During such implementation support actions, different implementation approaches, difficulties or best practices are brought up and discussed.

All EUR RASP actions, together with the main risks identified in EUR RASP as relevant for the particular State, should be considered for the establishment and implementation of the National Aviation Safety Plan (NASP).

How individual safety actions are presented

The information for individual actions is displayed in accordance with the below template:

Action reference	Action title		
(1) Short action description			
Status	*(2) new/ongoing*		
Reference(s)	*(3) References to other plans (e.g. GASP, ATM Master Plan), or other important documents, including safety promotion or guidance material that supports the EUR RASP action*		
Dependencies	*(4) Reference to the following categories of information:* - *GASP Goal 1-6* - *EPAS: EPAS reference number* - *Inter-dependencies among EUR RASP actions;*		
Affected stakeholders	*(5) List of main stakeholders affected using ICAO taxonomy and terminology*		
Owner	*(6) Entity responsible for implementing the action (Region, State, Industry, etc.)*		
EXPECTED OUTPUT			
Deliverable(s)		**Timeline**	
(7) Short description		*(8) Year/Quarter or 'continuous action'*	
CHANGES SINCE LAST EDITION			
(9) What changes were made compared to latest EUR RASP edition			
MONITORING			
Monitoring activities		**Related SPIs**	
(10) Short description		*(11) SPI reference*	

Each EUR RASP safety action is identified with a unique reference and title.

The action unique reference - **EUR.TTT.nnnn** – contains the following information:

- EUR - actions pertaining to EUR Region

- TTT - provides the type of action, either 'RMT' or 'SPT', in reference to the corresponding EPAS type of action

- nnnn the final number of the EUR RASP action.

Note 1: Only 'RMT', 'SPT' and 'MST' EPAS actions are considered for the EUR RASP. Relevant EPAS Member State Tasks (MSTs) are usually included as EUR RASP SPT actions.

- nnnn will be the unique reference number, allocated in chronological order of actions being added to the EUR-RASP.

Note 2: The MS©Excel support file will be maintained across the EUR RASP editions to show references between EUR RASP actions and corresponding EPAS actions. It will be made available upon request.

More information is provided, as follows:

(1) 'Short action description': the issue, objective and rationale are described.

(2) 'Status': new or ongoing.

(3) 'Reference(s)': related actions in other plans (e.g. ATM Master Plan, GASP) or other important reference documents, including Safety Recommendations (SRs), where relevant;

(4) 'Dependencies': may contain the following information:
- GASP Goal 1-6
- EPAS action reference number
- Reference to corresponding GASP SEIs, other relevant EUR RASP actions, relevant IE-REST SEIs and their description*, where applicable.*
- *Inter-dependencies among EUR RASP actions.*

(5) 'Affected stakeholders': list of main stakeholders affected, as per Annex B.

(6) 'Owner' of the action: e.g. States/Industry;

(7) 'Deliverable(s)': e.g. 'Regulatory framework in place', 'Safety Promotion material', etc;

(8) 'Timeline': year/quarter or continuous action;

(9) 'Changes since last edition':
This field provides information on changes in the EUR RASP action since the last EUR RASP edition, including clarification on the new action template and new numbering system introduced for this EUR RASP edition

Possible entries (one or more may apply):

- *n/a*: for newly introduced actions in the current EUR RASP edition. Since they are new, there are no changes to the previous edition of the plan.
- *Action title amended*: when the title of the action has been amended.
- *Action description amended*: when the description of the action has been amended.
- *Timeline (further) extended*.

(10) 'Monitoring activities': where relevant, short description of how the particular action will be monitored.

(11) 'Related SPIs': where applicable, corresponding EUR RASP SPIs (cf. Chapter 4).

In Chapter 5, within each subchapter, actions are grouped per topic and listed in ascending order of the unique EUR RASP action reference number.

2.3 How EUR RASP is monitored

The EUR RASP is monitored by means of two different mechanisms:

- Monitoring by means of specific SPIs, in accordance with **Chapter 4**, which presents the EUR RASP safety performance metrics reflecting the EUR RASP strategic priorities.

- Monitoring of EUR RASP action implementation, as well as of SSP & NASP implementation in general terms.

The second mechanism relies on annual EUR RASP implementation surveys as a means to regularly collect data and information from individual EUR States on the implementation of selected EUR RASP actions, in a structured manner. Staring in 2022 the annual survey uses the tools and processes established for the purpose of European ATM Master Plan Level 3 & Local Single Sky ImPlementation (LSSIP) reporting.

The annual surveys focus on the effective implementation of a selection of EUR RASP actions expected to be completed in the short term, generally those that have a target in the first and second year of the new reference period. A further prioritisation within those actions may be applied, in order to focus on those actions that are considered most relevant to address the various key risks.

In addition to the monitoring of specific EUR RASP actions the annual survey is also used to collect feedback on SSP and NASP(SPAS) implementation in more general terms, as well as provide a channel for States to inform the EUR RESG on their specific key risks and actions that may be of interest for the whole EUR region. Related data and information collected are assessed by the RESG RASP WG and EASPG RESG and new safety issues proposed will be considered in the subsequent EUR RASP planning cycle. The exchange of information on safety risks, actions and best practice will be encouraged through the survey.

All data and information collected by means of the annual survey feeds a single EUR RASP implementation report covering all EUR States.

The first formal EUR RASP implementation report will be available in 2023.

3. Strategic priorities

The following strategic priorities are based on the GASP challenges and priorities in safety planning, as well as the EPAS strategic priorities.

In addition to those priorities, civil-military cooperation is a crucial element to foster. Although only individual States can improve civil-military cooperation, within a regional approach in areas of highly fragmented airspace and in case of air encounters, certain facilities and services can be facilitated by the ICAO EUR/NAT Regional Office with limited effort, so as to ensure the safety, regularity and efficiency of civil aviation, while safeguarding that requirements for military air operations are met. The regional approach may support the promotion of a common understanding, the sharing of best practices and the monitoring of their practical implementation.

3.1   Systemic safety

3.1.1   Improve safety by improving safety management

Despite the fact that the last years have clearly brought continued improvements in safety across every operational domain, the latest accidents and serious incidents underline the complex nature of aviation safety and the significance of addressing human and organisational factor aspects. Aviation authorities and organisations should anticipate new emerging threats and associated challenges by developing Safety Risk Management (SRM) principles. Those principles will be strengthened by SMS implementation supported by ICAO Annex 19, strengthening occurrence reporting, follow-up and the protection of safety information. See Chapter **5.1.**

Effective safety management including robust risk management policies and processes are essential in dealing with the multiple impacts of the pandemic on the aviation system both at authority and organisation level.

3.1.2   Human factors and human performance

The role of human beings and the organisation in complex technical systems remains key in order to achieve better safety performance. Human factors and human performance are terms that are sometimes used interchangeably. While both human factors and human performance examine the capabilities, limitations and tendencies of human beings, they have different emphases:

- Human factors (HF) — is concerned with the application of what we know about human beings, their abilities, characteristics and limitations, to the design of equipment they use, environments in which they function and jobs they perform [7].
- Human performance (HP) — refers to how people perform their tasks. HP represents the human contribution to system performance[8].

The characteristics of the situations in which humans are placed make certain behaviours more likely. The object of Human and Organisational factors is then to consider the contribution to safety of organisational structure, design, operations, training, audit and control work.

---

[7]   Human Factors and Ergonomics Society, 2008
[8]   ICAO Human Performance Manual for Regulators, DOC 10151

The following safety issues are prioritised for more in-depth analysis. These issues are systemic safety issues, while other safety issues that also have human performance element may be addressed as part of the operational safety issue assessments:

- **Human Factors Competence for Regulatory Staff** - Without HF competencies, regulators cannot adequately oversee HF implementation of the aviation industry.

- **Design and Use of Procedures** – It is imperative for procedures to be designed so that they are usable, but this is increasingly difficult in the context of a complex system.

- **Senior Management Knowledge, Competence, & Commitment to HF/HP** - Unless senior management takes the lead in implementing human factors, the culture does not permeate throughout the organisation, with consequences for safety and efficiency.

- **Organisational and Individual Resilience** - Organisational and individual resilience are key factors in successfully managing safety, but there is little regulatory guidance on how to apply the concept.

- **Training Effectiveness and Competence** - There can be too large a gap between work as imagined and work as done, resulting in ineffective or negative training. Some changes to training regimes may exacerbate the problem.

- **Fatigue (quality sleep)** — Fatigue, including the aspect of quality sleep, has been identified as a safety issue, despite extensive research and regulation in this area.

EUR RASP actions **EUR.RMT.0009** and **EUR.SPT.0090** address **Human Factors Competence for Regulatory Staff**.

EASA identified further HF safety issues as part of its dedicated COVID-19 risk portfolio. The results of the in depth analysis of these issues led to the development of short-term mitigation actions, not qualifying for inclusion in EPAS. The more systemic issues or issues that are expected to remain in the medium to long term will be addressed as part of the regular European SRM cycle.

These COVID-19 related HF safety issues and corresponding mitigation actions are described below:

— **SI-5002 Aviation personnel fatigue**

With redundancy and furlough reducing the available number of personnel, those left working may have to work additional hours. The preparation for and eventual return to (new) normal operations will require significant additional effort in comparison with actual normal operations. The preparation for and eventual return to (new) normal operations will require significant additional effort in comparison with actual normal operations, in particular from the operators and Civil Aviation Authorities (CAAs). These may both contribute to rising levels of fatigue, that need to be effectively mitigated by the operators and overseen by the CAAs. These may both contribute to rising levels of fatigue. For this specific safety issue, the following resources are available:

- [Fatigue Management | EASA Community (europa.eu)](europa.eu)
- [Flight Time Limitation – guidelines for CAAs on temporary exemptions under Article 71(1) of Regulation (EU) 2018/1139 (the Basic Regulation) | EASA (europa.eu)](europa.eu)

— **SI-5003 Skills and knowledge degradation due to lack of recent practice**

The 90 % reduction in traffic means that most aviation professionals are not performing their normal tasks, sometimes they are doing a substantially different job, and sometimes they are not working at all or at a substantially reduced frequency. Simulator and classroom-based training has also not been taking place. Together, this results in a reduction in the skills and knowledge of aviation professionals and poses safety risks.

For this specific safety issue, the following resources are available:

- https://www.easa.europa.eu/community/topics/skills-and-knowledge-degradation

— **SI-5006 /5007 Decreased well-being of aviation professionals during shutdown**

The pandemic is a significant source of anxiety, stress and uncertainty for almost everyone. Worries about unemployment for aviation staff and their relatives may be exacerbated. During the shutdown, with people working from home and therefore isolated from normal support, the personal wellbeing of professionals is likely to have suffered. For those working, this may lead to task distraction/interruption, workload/task saturation, instructions or requirements not followed. Regardless of whether personnel are working, are employed, furloughed or unemployed, we have a duty of care to support the wellbeing of aviation professionals.

Personnel will be returning to duty with a higher than normal psychological stress, potentially reducing staff performance and increasing safety risks. Organisations and authorities need to understand and develop strategies to mitigate these risks.

For these two safety issues, EASA has created a wellbeing resource hub to support aviation professionals throughout the pandemic and beyond:

- https://www.easa.europa.eu/community/content/wellbeing

Specific information about personal wellbeing can be found in the section "Looking after yourself"

- https://www.easa.europa.eu/community/content/information-looking-after-yourself

Another section of the wellbeing hub provides information on "Managing others"

- https://www.easa.europa.eu/community/content/managing-others

There is also a range of career support material in the section "Managing the impact on your career"

- https://www.easa.europa.eu/community/content/managing-impact-your-career:

3.1.3   Competence of personnel

As new technologies and new business models or operational concepts emerge on the market and the complexity of the system continues to increase, it is of key importance for aviation personnel to have the right competences and adapt training methods to cope with new challenges, such as COVID-19.

It is important to recognise the positive contribution that aviation professionals can make in restarting a complex system. The ICAO Handbook for CAAs on the Management of Aviation Safety Risks related to COVID-19 (Doc 10144) advises the following:

'Identifying interfaces and establishing channels for communication provides access to expert opinion, which is valuable in understanding the available information in a dynamic situation. Responding under a crisis situation may require qualitative decision-making using a risk management approach and asking practical questions (e.g. What supporting evidence is available?, What are the consequences of alternative options?, How will delays in decisions impact?, What is the risk tolerability for the specific situation?, What are the available resources?).'

It is equally important for aviation personnel to take advantage of the opportunity presented by new technologies to enhance safety.

The safety actions related to aviation personnel are aimed at introducing competency-based training in all licences and ratings, and facilitating the availability of appropriate personnel in CAAs. These actions will contribute to mitigating related safety issues, which play a role in improving safety across all aviation domains. Training and education are considered key enablers. See Chapter 5.2.

The CAAs shall take due account of requests to introduce competency-based training and assessment (CBTA) for all categories of aviation personnel to whom the concept is addressed: flight crew personnel, aircraft maintenance personnel, air traffic management personnel , flight operations officers/flight dispatchers, remote pilots and other aviation personnel. A phased approach to gradually reach the level of maturity required for the full implementation should be adopted. The safety actions for the introduction of the new training concept may initially address pilots, through training organisations and operators.

Aviation personnel competency has also been raised as a safety issue arising from the COVID-19 pandemic. With significant reduction in air traffic most aviation professionals are no longer able to perform their normal operational activities on a regular basis. Some might be doing substantially different non-aviation related activities and some might not be working at all. The extended period of low activity is longer and affects a larger number of aviation personnel when compared with sick or sabbatical leave periods. The pandemic also reduced the possibilities for training as access to training facilities and FSTDs was severely restricted.

Language proficiency constitutes another focus area. The decision to address language proficiency requirements (LPRs) for pilots and air traffic controllers was first made by the 32nd Session of the ICAO Assembly in September 1998 as a direct response to several fatal accidents, including one that cost the lives of 349 persons as well as to previous fatal accidents in which the lack of proficiency in English was identified as a contributing factor. The intent was to improve the level of language proficiency in aviation worldwide and reduce the communication breakdowns caused by a lack of language skills. LPRs have now moved beyond implementation (Assembly Resolution A38-8 refers) entering a phase of post implementation.

Despite the successful establishment of national LPR systems there remains insufficient awareness, particularly in the selection of suitable and appropriate testing tools that meet ICAO LPRs which may result in safety risks.

Key actions in the area of **Language proficiency**:

- **EUR.RMT.0021** ICAO requirements for proficiency in languages used for radiotelephony communications language proficiency (ILPR) – rulemaking; and

- **EUR.SPT.0022** ICAO requirements for proficiency in languages used for radiotelephony communications language proficiency (ILPR) - safety promotion

3.1.4   Impact of security on safety

Cybersecurity

The aviation world is more and more digitally connected which provides for advantages but comes also with a huge variety of new challenges as there is an urgent need for protection of critical information and communications technology and data. An example may be the new generation of aircraft with systems connected to the ground in real time, or ATM technologies which function via wireless connections between the various ground centres and the aircraft. The digitalisation of aviation systems increases the vulnerability for cyber-attacks which may impact the whole system and endanger flight safety. It is an urgent need to foster harmonised and improved understanding and means for the protection of systems, security by design, supply chain security, redundancy and maintenance as well as highlight the core need of regular communication and information sharing. It is essential that the aviation industry and authorities find a way to share knowledge and learn from

each other's experience to ensure the aviation system can be protected in future, cyber-attacks get managed and business continuity is assured. It is furthermore essential to recognise that cybersecurity is a cross-cutting issue that involves all domains of the aviation sector; safety , security , air navigation etc. which need to cooperate to provide States and industry with a vision of the civil aviation sector as resilient to cyber-attacks, whilst continuing to innovate and grow.

<u>Conflict zones</u>

Military or terrorist conflicts may occur in any State at any time and pose risks to civil aviation. This is why it i important for governments, aircraft operators, and other airspace users such as air navigation service providers (ANSPs), to work together to share the most up-to-date conflict zone risk-based information possible to assure the safety of civilian flights. In the EUR region those risks have increased and remain under focus of regional safety activities as a safety priority.

Per their responsibilities as signatories to the Convention on International Civil Aviation (Chicago Convention), ICAO Member States are obliged to promptly communicate potential risks to safe and secure civil aviation operations in their sovereign or delegated airspace, including those relating to conflict zones. In addition, the airlines registered in States should also conduct their own proprietary conflict zone risk assessments, in order to safely plan their routes and operations based on the latest information available. To address this requirement the industry has adopted several tools to access information on conflict zones.

To support these safety risk mitigation actions ICAO amended its provisions and issued guidance to assist States, operators and ANSPs regarding conflict zone risks: Doc 10084, Risk Assessment Manual for Civil Aircraft Operations Over or Near Conflict Zones.

In European Union area Member States, European Institutions and EASA have established an alerting system with the objective of joining up available intelligence sources and conflict zone risk assessment capabilities in order to enable the publication of information and recommendations on conflict zone risks in a timely manner. It complements national infrastructure mechanisms, when they exist, by adding, when possible, a European level common risk picture and corresponding recommendations.

3.1.5   Civil-military coordination and cooperation

The global evolution of the ATM system guided by the Global Air Navigation Plan (Doc 9750) requires global, regional, and national cooperation between civil and State aviation authorities to ensure integration of State aviation needs and ensure planning by the State aviation authorities of the implementation of the ATM evolution. As airspace becomes more of a scarce and sought after resource, States need to take a balanced approach to airspace management. The airspace requirements of all civil and State (including military) users should be accommodated on a fair and equitable basis while respecting State sovereignty, national and international security, defence and law enforcement obligations.

Civil and military operations differ in nature and in purpose. While civil aviation supports global interaction and contributions to the global economy, military operations are conducted for national security or defence reasons. However, both types of operations take place in a single continuum of airspace and, therefore, civil aviation and military stakeholders need to cooperate to ensure their mutual safety. Successful cooperation is based on mutual trust, respect, transparency and understanding. Optimizing airspace for both civil and military operations results in nation-wide benefits. The flexible use of airspace (FUA) is a fundamental aspect in supporting the optimization process. It is recommended that civil and military experts jointly develop advice and guidance on the best practices for civil-military cooperation and coordination, including at the level of State safety management. The principle "as civil as possible-as military as necessary" intends to enhance interoperability,

performance and military mission effectiveness for military authorities, while providing performance benefits for the whole aviation system.

Airworthiness

Military aviation is the prerogative and the responsibility of a Member States, it would be beneficial from committing further to leverage and consolidate efforts by both civil and military in developing their aviation capabilities by applying the performance equivalence approach.

Safety intelligence and performance domains

The timely and accurate reporting of safety information at European level and beyond is critical to verify the achievement of global safety objectives and monitor the implementation of safety programme initiatives, including EPAS and EUR RASP.

Reliable military safety data sharing, primarily for military aerodromes open to public use and civil derivative aircraft, as well as dual-used platforms (mainly rotorcraft but also fixed wings in transport or training type operations), would provide perspectives that are both global in nature as well as specific to individual areas, such as rotorcraft, where a substantial fleet is operated by the military.

Going forward, tools to allow for a comprehensive assessment of safety performance, including State and military aircraft, would be of strong benefit to the entire aviation system and would support the goal of ensuring the highest common level of safety and environmental protection for the European aviation system.

Aviation security (including cybersecurity)

There is a shared understanding and growing concern within the military community that security and especially cybersecurity may introduce considerable risk for aviation, as systems on board aircraft and the European ATM System rely on increased connectivity. Moreover, effectively mitigating cyber-related risks is key to enabling unmanned aircraft systems (UAS) (or drones)[9] integration into non-segregated airspace. Moreover, close cooperation with the military stakeholders is also essential in scenarios where Counter UAS (C-UAS) measures would have to be developed and implemented.

The strategic orientations adopted by EASA in developing its cybersecurity roadmap and the setting up of the European Strategic Coordination Platform (ESCP) provide the military with an opportunity to cooperate in an area of common interest in the wider context of the European aviation system.

Airspace, ANS, aerodromes open to public use

To meet the aerodrome challenges of delivering sufficient capacity, civil and military aerodromes will need to make progress to achieve a seamless airspace and globally harmonised ANS, where civil-military cooperation is a crucial element to foster in the transition process.

Key to successful cooperation is the establishment of trust and transparency so that the needs and requirements of civil and military aerodromes and services providers could be fully understood and that over time an integrated model could be achieved.

With a regional approach in areas of highly fragmented airspace and aerodromes open to public use, certain facilities and services shall be arranged so as to ensure the safety, regularity and efficiency of civil aviation as well

---

[9] 'Unmanned aircraft systems (UAS)' is the legal and technical term used in the EASA Basic Regulation as well as in the delegated and implementing acts adopted on the basis thereof. 'Drones' is the popular term used to be understood by persons with no aviation background. Both terms are used in EPAS and refer to the same thing.

as to warrant that the requirements for military air operations are met, in particular by promoting a common understanding of key principles, sharing best practices and monitoring their practical implementation.

3.2 Operational safety

3.2.1 Address safety risks in Commercial Air Transport Aeroplanes and NCC operations (non-commercial operations with complex-motor powered aircraft, being part of business aviation)

Based on 2021 data, the number of accidents involving scheduled commercial operations with aircraft of maximum mass of over 5700 kg and occurring in one of the 55 States in the EUR Region has increased in 2021 compared to 2020: 12 of such accidents occurred in 2021, including two fatal accidents resulting in 32 fatalities. This resulted in a regional accident rate of 2.35 accidents per million departures, up 18% from the 2020 rate of 2.00 accidents per million departures..
This operational domain remains the greatest focus of the EUR safety activities.

The European SRM process identified the following as the most important risk areas for CAT Aeroplanes and NCC operations:

— *aircraft upset in flight (Loss of Control)*

   Aircraft upset or loss of control is the most common accident outcome for fatal accidents in CAT aeroplanes operations. It includes uncontrolled collisions with terrain, but also occurrences where the aircraft deviated from the intended flight path or intended aircraft flight parameters, regardless of whether the flight crew realised the deviation and whether it was possible to recover or not. It also includes the triggering of stall warning and envelope protections. **See Section 5.3.1.1.**

— *runway excursions, runway incursions and collisions*

   Runway safety events[10] remain the highest number of events: 11 of the 41 accidents involving aircraft of maximum mass of over 2 250 kg that occurred in the EUR Region in 2021 were runway safety-related, causing one fatality out of a total of 69.

   Runway excursion covers materialised runway excursions, both at high and low speed, and occurrences where the flight crew had difficulties maintaining the directional control of the aircraft or of the braking

---

[10] Runway safety-related events include the following ICAO accident occurrence categories: abnormal runway contact (ARC), bird strikes (BIRD), ground collision (G-COL), runway excursion (RE), runway incursion (RI), loss of control on the ground (LOC-G), collision with obstacle(s) during take-off and landing (CTOL) and undershoot/overshoot (USOS).

action during landing, where the landing occurred long, fast, off-centred or hard, or where the aircraft had technical problems with the landing gear (not locked, not extended or collapsed) during landing

Runway incursion refers to the incorrect presence of an aircraft, a vehicle or a person on an active runway or in its areas of protection, which can potentially lead to runway collision as the most credible accident outcome. **See Section 5.3.1.2.**

— *airborne collision*

Airborne collision includes all occurrences involving actual or potential airborne collisions between aircraft while both aircraft are airborne and between aircraft and other airborne objects (excluding birds and wildlife).

In 2020 the highest risk contributors were occurrences with loss of separation whilst performing a missed approach due to windshear encounter and several Airborne Collision Avoidance System (ACAS) resolution advisories cases*.* **See Section 5.3.1.3.**

3.2.2   Address safety risks in rotorcraft operations

In November 2018 EASA delivered a **Rotorcraft Safety Roadmap**[11] aiming at significantly reducing the number of rotorcraft accidents and incidents and focuses on traditional/conventional rotorcraft including GA rotorcraft where the number of accidents is recognised to be higher. It focuses on safety and transversal issues that are affected by the different domains including training, operations, initial and continuing airworthiness, environment and innovation.

Helicopter operators perform a wide range of highly specialised operations that are important for the European economy and citizens. There is a need to further develop towards an efficient regulatory framework, considering technological advancements.

Consequently the **Rotorcraft Safety Roadmap** specifies 3 objectives:

— Improve overall rotorcraft safety by 50 % within the next 10 years

— Make positive and visible changes to the rotorcraft safety trends within the next 5 years

— Develop performance-based and proportionate solutions that help maintain competitiveness, leadership and sustainability of European industry

In 2020, a review of the actions was performed to give priority on those supporting the industry during the pandemic. The external communication and events were cancelled, and the focus was shifted to the Return to Normal Operation project. Several actions of the Roadmap were put on hold or delayed.

The main subjects of the Roadmap were organised in work streams and are described below:

— Training Safety and Training Devices

— Safety Data

— Safety Promotion

— Helicopter Design Improvements

— Certification Specifications Modernisation

— Simplification – reduction of administrative burden for small helicopter operators

— Evaluation of new concepts.

---

[11]   https://www.easa.europa.eu/download/Events/Rotorcraft%20Safety%20Roadmap%20-%20Final.pdf

Further details on those can be found in EPAS 2022-2026 Section 3.1.2.2.

3.2.3   Address safety risks in GA in a proportionate and effective manner

In the last years, accidents involving recreational aeroplanes, i.e. non-commercially operated small aeroplanes with MTOMs below 5 700 kg, have led to high annual numbers of fatalities in Europe. Adding to that the number of fatal accidents involving micro-light airplanes, sailplanes and balloons makes GA one of the aviation sectors with the highest yearly number of fatalities.

Although it is difficult to precisely measure the evolution of safety performance in GA due to lack of consolidated exposure data (e.g. accumulated flight hours), it is reasonable to assume that more initiatives and efforts are needed to mitigate risks leading to these fatalities.

3.3   Safe integration of new technologies and concepts

Establishing and maintaining a high uniform level of civil aviation safety remains the highest objective. A more integrated approach will be allowed in the future to the introduction of new technologies, innovative solutions and operating concepts. To continue to maintain the highest possible safety standards in the future to come, such integrated approach considering the total aviation system will be essential.

Many of the technologies and innovations emerging in the aviation industry bear significant potential to further improve the level of safety, e.g. by improving the collection and analysis of operational data, better condition monitoring of aircraft for the purpose of preventive maintenance, improved accessibility and better quality of meteorological information, etc.

Digitalisation and automation are rapidly increasing in aviation systems. While this has resulted overall in significantly improved safety, the trend towards increasing automation requires a renewed safety focus on the interactions between humans and automation. The next generation of automation will be using Artificial Intelligence (AI). This domain, no longer the province of science fiction, could well be the next 'game-changer' for aviation . In the near future, new EUR RASP actions may be required to maximise related safety benefits, while mitigating any threats induced by the implementation of these new technologies.

3.3.1   Artificial intelligence (AI)

AI, and more specifically the Machine Learning (ML) field of AI, bears enormous potential for developing applications that would not have been possible with the development techniques that were used so far. AI will affect most aviation domains, not only in terms of products and services provided by the industry, but also in relation to the rise of new business models that need to be accounted for in certification, rulemaking, an oversight. This may in turn affect the competency framework of CAA staff.

AI is by essence multidisciplinary and will require a coordinated risk management approach, to ensure safety within the total aviation system.

3.3.2   Ensure the safe operation of UAS (drones)

There is a need to create an adequate regulatory framework that will enable safe operations of UAS and the integration of these new airspace users into the EUR airspace.

As technology advances, consistent requirements and expectations in an already crowded airspace will help manufacturers to design for all conditions and make it easier for operators to comply with requirements.

Moreover, as the number of UAS operations increases, there is a need to establish unmanned traffic management (UTM) systems (named 'U-space' in Europe). There has been a huge development of U-space over the last years and it is expected that this will develop even faster in the years to come.

The number of drones within the EUR region has multiplied over the last years. Available data also shows the increase of drones coming closer to manned aviation (both aeroplanes and helicopters), thereby confirming the need to mitigate the associated risk.

The analysis of the events in Gatwick in December 2018 has clearly identified the need to support aerodrome operators, aircraft operators and ATS providers to be better prepared to manage the presence of unauthorised drones around aerodromes, while ensuring the business continuity. This implies among others provision of guidance on roles and responsibilities between the different actors and on the various counter drone mitigations ranging from prevention, surveillance, detection and disruption of unauthorised drones.

In order to avoid a diversity of national measures, EASA had proposed to act as the European coordinator of an action plan containing five objectives and to collaborate with the affected stakeholders, namely the Member States (including CAAs and Law Enforcement Authorities), aerodrome operators, aircraft operators, ANSPs, EUROCONTROL and the EC. This led to the publication of the EASA Counter-UAS Action Plan.

This Plan, which is subject to periodic review and amendment. The latest Issue 3 includes numerous amendments to the C-UAS Action Plan as the work on the implementation progresses.

— The Action Plan is articulated around five objectives: Objective #1: Educate the public to prevent and reduce misuse of drones around aerodromes

— Objective #2: Prepare aerodromes to mitigate risks from unauthorised drones use

— Objective #3: Support the assessment of the safety risk of drones to manned aircraft with scientific data

— Objective #4: Ensure that C-UAS measures are swiftly considered and implemented from a global safety perspective

— Objective #5: Support adequate occurrence reporting

Key actions in the area of **UAS (drones)**:

- **EUR.RMT.0083**   Introduction of a regulatory framework for the operation of drones

- **EUR.SPT.0084**   European Safety Promotion on civil drones

- **EUR.SPT.0095**   Counter-UAS drone measures and drone incident management at aerodromes

3.3.3   New operating concepts and business models

Some new business models such as those responding to the increased demand for flying in the cities (e.g. 'urban air mobility') or those generated by the increased digitalisation in the aviation industry (virtual/ augmented reality, digital twins, etc.), the possible introduction of more autonomous vehicles and platforms, single-pilot operations and completely autonomous cargo aircraft, will challenge the way authorities regulate and oversee the aviation system. Until now, the air travel over urban areas has been limited to very special operations, such as police operations or helicopter emergency medical services (HEMS). New aviation partners are seeking new business models to provide more services to citizens, ranging from parcel delivery by air within the cities to flying air taxis. These new business models and operations need to be performed in a safe and secure manner to maintain the confidence that citizens have in the air transport system. Electric and hybrid propulsion, vertical take-off and landing (VTOL) aircraft.

Innovation in any industry is a key factor influencing its competitiveness, growth and employment potential. With this strategic priority in mind, and looking at the increasing number of new aircraft manufacturers and suppliers working on aircraft using electric propulsion (and increasingly electric systems), it becomes apparent that there are very strong prospects as well as demand, from industry and governments, to have hybrid propulsion and eventually fully electric aircraft. The use of electric and hybrid propulsion systems has the potential of significantly reducing aviation environmental footprint. However, in order to ensure that this objective is met, the full life cycle of the product needs to be taken into account as well as the energy mix used.

To encourage the safe integration of new technological advancements in the wider electrical aviation sector overall, flexibility in the approach on all types of concepts, variations and design types will be enhanced.

To allow for the projects to thrive, a number of complex issues need to be tackled from a regulatory perspective, starting with creating the required certification standards to adapting operational and licensing rules, as well as ATM/ANS and aerodrome rules.

3.3.4   Electric and hybrid propulsion, vertical take-off and landing (VTOL) aircraft

Transport modes are increasingly considering the use of electric and hybrid propulsion and aviation is not an exception. In the domain of civil aviation, electric and hybrid propulsion started off in light General Aviation/leisure flying aircraft and the lower end of unmanned aircraft systems. The latest technological developments (e.g. hybrid technology, fuel cell, distributed propulsion and lift, urban air mobility solutions with electric propulsion VTOL aircraft, aeroplanes with a high number of motors and propellers/fans, high voltage levels) are promising to make electrification more and more attractive and feasible in aviation, hence an increasing number of projects developed by the industry for a potentially huge market. While most of those projects currently address smaller aircraft and UAS, some projections foresee that regional aircraft (around 40 seats) could fly fully electrically in the range between 2030 and 2040[12].

The use of electric and hybrid propulsion systems has the potential to significantly reduce the aviation environmental footprint. However, in order to ensure that this objective is met, the full life cycle of the products needs to be taken into account as well as the energy mix used. In addition to their disposal the safe storage of batteries on ground will also need to be addressed.

To encourage the safe integration of new technological advancements in the wider electrical aviation sector overall, flexibility in the approach on all types of concepts, variations and design types should be enhanced.

To allow such projects to thrive and enable their safe integration into the aviation system, a number of complex issues need to be tackled from a regulatory perspective, given that most of the aviation requirements are still referring to the use of hydrocarbon-based fuel and traditional power plant categories (piston engine, turboprop, turbofan and turbo shaft). This concerns not only **aircraft design requirements** (addressing in particular the hazards created by the carriage of high-voltage systems on-board the aircraft), but also **operational, flight crew licensing, maintenance, air navigation** and **aerodrome** requirements.

An overarching objective should be to apply and ensure a level of safety of electrical and hybrid propulsion products, at least equivalent to that achieved for the *traditional* combustion-based propulsive systems.

---

3.3.5 Enable all-weather operations

The European industry should have the capability to take full advantage of the safety and economic benefits generated through new technologies and operational experience. This represents a widely recognised interoperability subject touching on a wide range of areas, including performance-based aerodrome operating minima (PBAOM), related aerodrome equipment to support such operations, and procedures for both CAT and General Aviation/leisure flying.

Aircraft operations have always been influenced by the weather. Whilst modern aircraft design and the availability of weather observations and forecasts contribute to a predominantly very safe flying environment, there remain occasions where severe weather events have been identified as being a contributing factor in the causal chain of accidents and incidents. Such events remain of concern within the aviation community and corresponding SRs have been addressed by accident investigation authorities.

Nine recommendations are proposed to further improve weather information and awareness:

— **Recommendation #1: Education and training:** require specific education and training on weather hazards, mitigation, and use of on-board weather radar.

— **Recommendation #2: Improved weather briefing presentation:** promote improvements to the presentation of weather information in-flight briefing.

— **Recommendation #3: Promotion of in-flight weather information updates:** promote the use of the latest information available to ensure up-to-date situational awareness.

— **Recommendation #4: Pan-European high-resolution forecasts:** support the pan-European developments regarding the provision of high-resolution forecasts for aviation hazards (e.g. CAT, icing, surface winds, cumulonimbus (CB), winter weather).

— **Recommendation #5: Use of supplementary 'Tier 2' weather sources for aviation purposes:** develop the necessary provisions to support the use of supplementary 'Tier 2' meteorological information by pilots.

— **Recommendation #6: Development and enhancement of aircraft sensors/solutions:** promote the development of intrinsic aircraft capabilities to facilitate the recognition and, if required, the avoidance of hazardous weather.

— **Recommendation #7: Connectivity to support in-flight updates of meteorological information:** promote deployment of connectivity solutions (uplink and downlink) to support the distribution of meteorological information to pilots.

— **Recommendation #8: Provision of enhanced meteorological information:** promote provision of high-resolution observed and forecast meteorological information, particularly data with high spatial and temporal resolution such as imagery derived from satellite and ground weather radar sources.

— **Recommendation #9: On-board weather radar, installation of latest generation equipment:** promote the installation of the latest generation of on-board weather radars, with emphasis on including capability for wind shear and turbulence detection.

4. EUR Safety Metrics and Targets

The following EUR Safety Performance Indicators (EUR SPIs) were defined for the EUR RASP 2023 – 2025, reflecting the goals and targets from GASP 2023-2025:

EUR RASP Target	EUR SPI ID	EUR SPI Text
GASP Goal 1: Achieve a continuous reduction of operational safety risks		
1.1 EUR States to maintain a decreasing trend of regional accident rate	EUR.SPI.1.1.01	Number of accidents involving scheduled commercial operations with aircraft of maximum mass of over 5700 kg and occurring in EUR Region
	EUR.SPI.1.1.02	Number of accidents involving scheduled commercial operations with aircraft of maximum mass of over 5700 kg and occurring in EUR Region per million departures (accident rate)
	EUR.SPI.1.1.03	Number of fatal accidents to aircraft of 5700 kg or more occurring in the EUR Region
	EUR.SPI.1.1.04	Number of fatal accidents involving scheduled commercial operations with aircraft of maximum mass of over 5700 kg and occurring in EUR Region per million departures (fatal accident rate)
	EUR.SPI.1.1.05	Number of fatalities in accidents to aircraft of 5700 kg or more occurring in the EUR Region
	EUR.SPI.1.1.06	Number of fatalities in accidents involving scheduled commercial operations with aircraft of maximum mass of over 5700 kg and occurring in EUR Region per passengers carried (fatality rate)
	EUR.SPI.1.1.07	Percentage of accidents to aircraft of 2250 kg or more occurring in the EUR Region related to high-risk categories (HRCs)
	EUR.SPI.1.1.08	Number of accidents to aircraft of 2250 kg or more occurring in the EUR Region
GASP Goal 2: All States to strengthen their safety oversight capabilities		
2.1 EUR States to improve their EI score for critical elements (CEs) of the State's safety oversight system (with focus on priority PQs) as follows: — **by 2024 – 75 per cent** — **by 2026 – 85 per cent** — **by 2030 – 95 per cent**	EUR.SPI.2.1.01	Number of EUR States that met the EI score as per the timelines
	EUR.SPI.2.1.02	Number of EUR States that have fully implemented the priority Protocol Questions (PQ) related to a safety oversight system
	EUR.SPI.2.1.03	Percentage of required corrective action plans (CAPs) submitted by EUR States
	EUR.SPI.2.1.04	Percentage of completed CAPs per EUR State
GASP Goal 3: Implement effective State Safety Programmes (SSPs)		
3.1 By 2023, all EUR States to implement the foundation of an SSP	EUR.SPI.3.1.01	Number of EUR States having implemented the SSP foundational PQs
	EUR.SPI.3.1.02	Percentage of required CAPs related to the SSP foundational PQs submitted by EUR States (using OLF)
	EUR.SPI.3.1.03	Percentage of required CAPs related to the SSP foundational PQs completed per EUR State (using OLF)
3.2 By 2024, all EUR States to publish a NASP	EUR.SPI.3.2.01	Number of EUR States having published their NASP
3.3 All States to work towards an effective SSP as follows: **a) by 2025 – Present**	EUR.SPI.3.3.01	Number of EUR States having an SSP that is present
	EUR.SPI.3.3.02	Number of States having an SSP that is present and effective
	EUR.SPI.3.3.03	Number of States that require applicable service providers under their authority to implement an SMS

b) by 2028 – Present and effective		

The terms "present" and "present and effective" are based on the maturity levels established in the ICAO SSP Implementation Assessment (SSPIA).

EUR RASP Target	EUR SPI ID	EUR SPI Text
GASP Goal 4: States to increase collaboration at the regional level to enhance safety		
4.1 By 2023, EUR States that do not expect to meet GASP Goals 2 and 3, to seek assistance to strengthen their safety oversight capabilities or facilitate SSP implementation	EUR.SPI.4.1.01	Number of States actively seeking assistance, by using a regional safety oversight mechanism, another State or other safety oversight organization's ICAO-recognized functions
	EUR.SPI.4.1.02	Number of EUR States that submitted a draft NASP to an ICAO EUR/NAT Regional Office
	EUR.SPI.4.1.03	Number of EUR States registered in the NASP Online Community
4.3 By 2025, all States to contribute information on operational safety risks, including SSP safety performance indicators (SPIs), and emerging issues, to their respective regional aviation safety group (RASG)	EUR.SPI.4.3.01	Number of EUR States registered to the Secure Portal on Emerging Issues and Additional Categories of Operational Safety Risks
	EUR.SPI.4.3.02	Number of EUR States that are sharing their SSP SPIs with EASPG
	EUR.SPI.4.3.03	Number of reports received via the Secure Portal on Emerging Issues and Additional Categories of Operational Safety Risks and validated from EUR entities
GASP Goal 5: Expand the use of industry programmes and safety information sharing networks by service providers		
5.1 Maintain an increasing trend in EUR industry's contribution in safety information sharing networks to EUR States and within EUR region to assist in the development of national and regional aviation safety plans	EUR.SPI.5.1.01	Number of EUR service providers using globally harmonized metrics for their SPIs
	EUR.SPI.5.1.02	Percentage of EUR service providers participating in the corresponding ICAO-recognized industry assessment programmes
	EUR.SPI.5.1.05	Number of EUR States having established safety data collection and processing systems (SDCPS) to facilitate participation in a safety information-sharing network
GASP Goal 6: Ensure the appropriate infrastructure is available to support safe operations		
6.1 By 2025, maintain an increasing trend of EUR States with air navigation and aerodrome infrastructure that meets relevant ICAO Standards	EUR.SPI.6.1.01	Number of infrastructure-related air navigation deficiencies for EUR States against the EUR regional air navigation plan
	EUR.SPI.6.1.03	Number of EUR States having implemented infrastructure-related PQs linked to the basic building blocks

Volume II

5. Safety Actions

This chapter groups all EUR RASP actions, allocated to different sub-chapters as per systemic/operational domain. Actions are further grouped by Key Risk Area in sub-chapters **1.1** 'Flight operations – aeroplanes' and **5.5** 'Flight operations – General Aviation/leisure flying'.

New safety actions are included with red text for the reference.

Safety actions whose reference is followed by '*' are within the scope of the first EUR RASP Implementation Survey initiated on 27th October 2022.

5.1 Systemic safety

This area addresses system-wide problems that affect aviation as a whole. In most scenarios, these problems are related to human factors, human performance limitations, competence of personnel, socio-economic factors or to deficiencies in organisational processes and procedures, whether at authority or industry level.

This area also includes the impact of security on safety.

5.1.1 Safety and quality management

Safety management is a strategic priority. Despite the fact that last years have clearly brought continued improvements in safety across every operational domain, recent accidents underline the complex nature of aviation safety, the importance of hazard identification and associated risk mitigation, and the significance of addressing human factor/human performance aspects. Authorities and aviation organisations should have agile (safety) management systems (SMS), implementing robust Safety Risk Management (SRM) principles and including whenever possible short-loop safety monitoring processes[1]. The situation with the COVID-19 pandemic, global and regional economical and geopolitical crises illustrate their importance across all domains.

The SMS principles will be strengthened through SMS implementation supported by ICAO Annex 19.

EUR.RMT.0001*	Embodiment of safety management system (SMS) requirements into applicable State's legislation

The objective of this action to ensure the full transposition of ICAO Annex 19 for safety management and to support effective implementation by service providers.

EUR.SPT.0004	Safety management implementation and international cooperation

Promote the common understanding of safety management and human factors/human performance principles within and outside Europe, share lessons learned and encourage progress and harmonisation, through active participation in the Safety Management International Collaboration Group (SMICG) and dissemination of safety promotion material to support effective safety management system (SMS) and State Safety Programme (SSP) implementation, including, but not limited to, the below deliverables and material addressing the EU context.

The latest SMICG deliverables include:
— *Updated Safety Management Terminology*
— *State Safety Programme (SSP) brochure*

Forthcoming SMICG material:
— *Effective Surveillance Following the Introduction of SMS*
— *Management of Change at State Level: Considerations*
— *Safety Manager's Role in SMS, including competency and training requirements*
— *Performance-Based/Risk-Based Oversight*
— *SMS Flyer on Design, Manufacturing and Production Organisations*

Latest EASA material:
— *Effective SMS implementation: SMS Q&A webinar*
— *EASA safety week 2022: recordings and material]*
— *EASA Covid-19 Resources , including the aviation safety issues arising from the Covid-19 Pandemic and the role of operators' management systems in the Covid-19 recovery phase (with new scenarios)*
— *Guide for compliance with Part-145 as amended by EU Regulation 2021/1963 (revision June 2022)*

Forthcoming EASA material:
— *SMS in Part-145 and Part 21: practical implementation*
— *Upgraded EASA MS assessment tool , including Part-CAMO, Part-145 and Part 21*

Status	*ongoing – continuous action*

EUR.SPT.0005	**States to implement effective State Safety Programmes (SSPs)**

In the implementation and maintenance of the SSP, States shall in particular:
- *ensure effective implementation of the Annex 19 Requirements and address deficiencies in oversight capabilities, as a prerequisite for effective SSP implementation,*
- *ensure effective coordination between State authorities having a role in safety management,*
- *ensure that inspectors have the right competencies to support the evolution towards risk- and performance based oversight,*
- *ensure that policies and procedures are in place for risk- and performance based oversight, including a description of how an SMS is accepted and regularly monitored,*
- *establish policies and procedures for safety data collection, analysis, exchange and protection,*
- *establish a process to determine safety performance indicators at State level addressing outcomes and processes,*
- *ensure that an approved SSP document is made available and shared with other States, and*
- *ensure that the SSP is regularly reviewed and that SSP effectiveness is regularly assessed.*

Status	*ongoing*
Reference(s)	*ICAO Annex 19* *GASP SEI-13 — Start of SSP implementation at the national level* *GASP SEI-14 — Strategic allocation of resources to start SSP implementation* *GASP SEI-15 — Strategic collaboration with key aviation stakeholders to start SSP implementation* *GASP SEI-16 — Strategic collaboration with key aviation stakeholders to complete SSP implementation*

MONITORING	
Monitoring activities	**Related SPIs**
n/a	*n/a*

EUR.SPT.0008*	States to establish and maintain a National Aviation Safety Plan (NASP)

States should ensure that a NASP is maintained and regularly reviewed.

States should identify in NASP the main safety risks affecting their national civil aviation safety system and shall set out the necessary actions to mitigate those risks. In doing so, States should consider the pan-European safety risk areas identified in EUR RASP for the various aviation domains as part of their SRM process and, when necessary, identify suitable mitigation actions within their NASP. In addition to the actions, NASP shall also consider how to measure their effectiveness. States should justify why action is not taken for a certain risk area identified in EUR RASP.

The pan-European top key risk areas as determined through the European SRM for various operational domains are defined in EASA Annual Safety Review (ASR) and in EPAS Volume I. Underlying causal and contributing factors ('safety issues') are described in EPAS Volume III.

The NASP should:

— *describe how the plan is developed and endorsed, including collaboration with different entities within the State, with industry and other stakeholders (unless this is described in the SSP document),*

— *include safety objectives, goals, indicators and targets (unless these are included in the SSP document),*

— *reflect the EUR RASP actions as applicable to the State,*

— *identify the main safety risks at national level in addition to the ones identified in EUR RASP.*

States should ensure that their NASP is made available to relevant stakeholders and are invited to share it with the other States and ICAO.

Status	*ongoing*
Reference(s)	*GASP SEI-11 (States) — Strategic collaboration with key aviation stakeholders to enhance safety in a coordinated manner* *GASP SEI-17 (States) — Establishment of safety risk management at the national level (step 1)* *GASP SEI-18 (States) — Establishment of safety risk management at the national level (step 2)* *GASP SEI-19(States) — Acquisition of resources to increase the proactive use of risk modelling capabilities* *GASP SEI-20 (States) — Strategic collaboration with key aviation stakeholders to support the proactive use of risk modelling capabilities* *GASP SEI-21 (States) — Advancement of safety risk management at the national level* *IE-REST SEIs (States) — Mitigate contributing factors to the risks of CFIT, LOC-I, MAC, RE, and RI*
Dependencies	*GASP Goal 3* *EPAS MST.0028*

5.1.2   Human factors and human performance

Human factors and the impact on human performance, as well as medical fitness are strategic priorities. As new technologies and/or operating concepts emerge on the market and the complexity of the system continues increasing, it is of key importance to properly assess human factors and human performance, in terms of both limitations and its contribution to delivering safety, as part of the safety management implementation.

The safety actions identified currently — related to aviation personnel — are aimed at updating fatigue risk management (FRM) requirements and contributing to mitigating safety issues in all domains such as personal readiness, flight crew perception or crew resource management (CRM) and communication, which play a role in improving safety across all aviation domains.

EUR.RMT.0009	Implement HF competency framework for regulatory staff and enhance HF training for all categories of regulatory staff

Ensure that regulatory staff have the right skills, knowledge and attitude to deal with HF issues and promote HF principles in regulations, oversight, enforcement and safety promotion.

States shall :
- *implement a HF competency framework for their regulatory staff*
- *implement competency assessment of regulatory staff before and after training.*
- *make available guidance for the appropriate level of HF competency for HF trainers.*

This action mitigates against risks generated through the inadequate understanding, regulation and oversight of human factors.

The ICAO Regional Office shall support the implementation of the HF competency framework , e.g. through dedicated workshops.

Status	*Ongoing*

EUR.SPT.0090	Foster a common understanding, regulation and oversight of Human Factors

This action includes some preparatory activities which will be performed by EASA with the support of the Human Factor Collaborative Analysis Group (HF CAG) in terms of:

- development of guidance and tools for the competency assessment of regulatory staff before and after training;
- guidance for the appropriate level of Human Factors competency for Human Factors trainers;
- development of promotion material to be provided as guidance to Member States and encourage implementation.

These guidance and tools will be provided to the competent authorities to organise the implementation of the competency framework, and plan and conduct the training for the respective regulatory staff

Furthermore, this action involves expanding the scope of the existing Human Factors competency framework for inspectors to cover all categories of regulatory staff and to mitigate against risks generated through the inadequate understanding, regulation and oversight of HF and supports effective SMS implementation in Industry.

States shall make use of the Human Factors competency framework that will be developed by EASA with the support of its HF CAG. The competency framework will become available in 2022.

EUR.SPT.0092	Safety promotion campaign to mitigate aircrew fatigue

Launch and implement safety promotion making use of practical guides, promotional material and e-learning content developed by EASA to address Aircrew Fatigue.

This will include written and video materials containing explanatory material, examples, FAQs and recommendations.

EASA delivered so far:
- *IFTSS (individual flight time specification scheme) Evaluation Form in 2018;*
- *FTL/FRM Inspector's checklists (1st & 2nd parts) in 2019;*
- *FTL/FRM Practical Guide Issue 1 in 2019.*

https://www.easa.europa.eu/document-library/general-publications/effectiveness-flight-time-limitation-ftl-report

EASA will deliver:
- *FTL/FRM Inspector's checklist (3rd part);*
- *FTL/FRM Practical Guide Issue 2.*

Status	*ongoing*

5.1.3 Aircraft tracking, rescue operations and accident investigation

Safety investigation authorities have frequently raised the issue of lack of data to support investigations of light aircraft accidents. This is also related to the fact that light aircraft are not required to carry a flight recorder. As regards large aircraft, the advent of new technologies, as well as findings during safety investigations highlight the need to update the installation specifications for flight recorders.

The safety actions in this area are aimed at improving the location of an aircraft in distress, improving the availability and quality of data recorded by flight recorders, assessing the need for in-flight recording for light aircraft and the need to introduce data link recording for in-service large aircraft.

EUR.RMT.0015	Amendment of requirements for flight recorders and underwater locating devices

Amend applicable regulations to comply with latest ICAO requirements for flight recorders and underwater locating devices

Status	*ongoing*

5.1.4   Impact of security on safety

The safety actions in this area are aimed at mitigating the security-related safety risks.

The safety actions in this area also include the mitigation of the risks posed by flying over zones where an armed conflict exists.

Managing the impact of security on safety is a strategic priority.

EUR.RMT.0016*	Cybersecurity risks

Create a regulatory system which efficiently contributes to the protection of the aviation system from cyber-attacks and their consequences. To achieve this objective it is proposed to introduce a regulation covering all the aviation domains (design, production, maintenance, operations, aircrew, ATM/ANS, ADRs), which include high-level, performance-based requirements, supported as applicable by acceptable means of compliance (AMC), guidance material and Industry Standards.

EUR.SPT.0017	Strategy for Cybersecurity in Aviation

Citizens travelling by air are more and more exposed to cybersecurity threats. The new generation of aircraft have their systems connected to the ground in real time. Air traffic management technologies require internet and wireless connections between the various ground centres and the aircraft. The multiplication of network connections increase the vulnerability of the whole system.

In order to address those concerns, Regions/States should develop a Strategy for Cybersecurity in Aviation . This strategy should include, among others, actions in the following areas:
— Information sharing
— Research and studies
— Event investigation and response
— Knowledge and competence building
— International cooperation and harmonization
— Regulatory activities and development of Industry Standards

5.1.5 Oversight capabilities

The safety actions in this area focus on strengthening the safety oversight capabilities of States. Annex 19 introduced the concept of risk-based oversight with the objective of addressing safety issues with a consideration to efficiency.

The following are enablers of a robust safety oversight system:

- ability and determination to conduct effective oversight;

- ability to identify risks through a process to collect and analyse data;

- ability to mitigate the identified risks in an effective way, implying measurement of performance and leading to continuous improvement;

- willingness and possibility to exchange information and cooperate with other States' Competent Authorities;

- ability to ensure the availability of adequate personnel, where 'adequate' includes the notion of sufficient training and proper qualification; and

- focus on the implementation of effective management systems in industry, wherever required by the regulations in force.

EUR.RMT.0019	Regulation and Oversight of Search and Rescue (SAR) services

Review and improve existing regulatory requirements and guidance material for the establishment and safety oversight of Search and Rescue services, making use of the documents developed by the EUR SAR Task Force.

Status	*ongoing*

EUR.RMT.0020*	Oversight capabilities/focus areas

To further strengthen the oversight capabilities, CAA should address the following systemic focus areas:

(a) Availability of adequate personnel in CAAs
States to ensure that adequate personnel is available to discharge their safety oversight responsibilities;

(b) Cooperative oversight in all sectors
States to ensure cooperation where the oversight of an organisation involves more than one State, to ensure that those activities are adequately overseen, either with or without an agreed transfer of oversight tasks.

(c) Organisations' (safety) management system in all sectors
States to foster the ability of CAAs to assess and oversee the organisations' (safety) management system in all sectors. This will focus in particular on safety culture, the governance structure of the organisation, the interaction between the risk identification/assessment process and the organisation's monitoring process, the use of inspection findings and safety information such as occurrences, incidents, and accidents. This should lead CAAs to adaptation and improvement of their oversight system.

Status	*ongoing*

EUR.RMT.0024	Improve flight simulation training devices (FSTDs) fidelity

An ICAO harmonisation issue, as the main purpose is to include in the applicable legislation elements from ICAO Doc 9625 for the use of FSTDs in flight training. The task will also address three safety recommendations (SRs) and aims at including results and findings from the loss of control avoidance and recovery training (LOCART) and other working group results. Harmonisation with the Federal Aviation Administration (FAA) should be considered.

Subtask 1 - increase the fidelity of the provisions to support the approach-to-stall training, as well as of the new upset prevention and recovery training (UPRT) requirements

Subtask 2 - The main objective of Work Subtask 2 (SubT 2) is to review the technical requirements for training devices in order to:
(1)   reflect their actual capability and technology advancement in support of introducing the 'task to tool' – concept for aeroplanes and helicopters; and
(2)   to enable special conditions for other categories of aircraft.

Subtask 3 - The main objective of Subtask (SubT 3) is to enable the crediting of training for flight crew using innovative training technologies, such as virtual reality. Additionally, it is aimed at developing more proportionate requirements for FSTD operators that operate only flight navigation and procedures trainers (FNPTs) and other simulation training tools, and at reviewing the initial qualification process of these FNPTs to transfer the responsibility to the training device manufacturer. Finally, the intention is to develop appropriate standards for new technologies, such as off-board instructor operating stations and secondary motion systems, also considering any special conditions developed in parallel to the rulemaking activity..

EUR.SPT.0027*	Flight examiner manual

Enhance the application and harmonisation among flight examiners of standards and best practices to ensure that any applicant is qualified by a comparable level of knowledge, competence and skill.

Through a reliable and objective testing and checking guidance, foster the achievement of optimal outcomes in the interest of effectiveness, efficiency, fairness and transparency. Promote the application of common standards for training programmes for examiners among all EUR States' CAAs.

This SPT will entail :
₋ developing a flight examiner manual (FEM) that provides guidelines to flight examiners on the conduct of examinations with a view to improving the standardisation and fairness of examiners at EU level.
₋ providing recommendations to competent authorities on the usefulness of using common standardised forms and, in addition, common notification procedure(s) for examiners with a valid examiner certificate.

5.3 Flight operations — aeroplanes

This chapter groups all actions in the area of CAT by aeroplane (airlines and air taxi, passengers/cargo, aeroplanes of all mass categories), non-commercial operations with complex motor-powered aircraft (NCC), as well as specialised operations (SPO) involving aeroplanes of all mass categories.

5.3.1 CAT & NCC operations

The operational domain CAT and NCC by aeroplane remains the greatest focus of the EUR region safety activities. For CAT by large aeroplane and NCC, sufficient safety and exposure data is available in these domains to enable the definition of specific safety performance metrics

5.3.1.1 Aircraft upset in flight (LOC-I)

Loss of control usually occurs because the aircraft enters a flight regime which is outside its normal envelope, usually, but not always, at a high rate, thereby introducing an element of surprise for the flight crew involved. Prevention of loss of control is a strategic priority.

Aircraft upset or loss of control is the key risk area with the highest cumulative risk score related to fatal accidents in CAT aeroplane operations. It includes uncontrolled collisions with terrain, but also occurrences where the aircraft deviated from the intended flight path or intended aircraft flight parameters, regardless of whether the flight crew realised the deviation and whether it was possible to recover or not. It also includes the triggering of stall warning and envelope protections.

EUR.RMT.0029*	Loss of control prevention and recovery training

Review of the provisions for initial and recurrent training in order to address upset prevention and recovery training (UPRT). The review will also address the implementation of the ICAO provisions (namely Annex 1, Annex 6 part I, PANS-TRG, Doc 9868, Doc 10011, Doc 9625).

Other aspects to be covered are manual aircraft handling of approach to stall and stall recovery (including at high altitude), the training of aircraft configuration laws, the recurrent training on flight mechanics, and training scenarios (including the effect of surprise).

5.3.1.2 Runway safety

This section deals with runway excursions, runway incursions and runway collisions, and is a strategic priority.

Runway excursion covers materialised runway excursions, both at high and low speed, and occurrences where the flight crew had difficulties in maintaining the directional control of the aircraft or of the braking action during landing, where the landing occurred long, fast, off-centred or hard, or where the aircraft had technical problems with the landing gear (not locked, not extended or collapsed) during landing.

Runway incursion refers to the incorrect presence of an aircraft, vehicle or person on an active runway or in its areas of protection, which can potentially lead to runway collision as the most credible accident outcome. Despite the relatively low number, the risk of the reported occurrences was demonstrated to be very real.

EUR.RMT.0032	Review of aeroplane performance requirements for operations

Develop regulatory material to provide improved clarity, technical accuracy, flexibility or a combination of these benefits for the operational requirements on aeroplane performance in air operations with the aim of reducing the number of accidents and serious incidents where aeroplane performance is a causal factor.

5.3.1.3 **Airborne conflict (mid-air collisions)**

Airborne collision includes all occurrences involving actual or potential airborne collisions between aircraft, while both aircraft are airborne, and between aircraft and other airborne objects (excluding birds and wildlife). This also includes all separation-related occurrences caused by either air traffic control or cockpit crew, AIRPROX reports and genuine ACAS alerts. It does not include false ACAS alerts caused by equipment malfunctions, or loss of separation with at least one aircraft on the ground, which may be coded as ground damage if the occurrence meets the criteria and usage notes for those categories. 18.

EUR.SPT.0033	Safety Promotion on Mid-Air Collisions (MAC) and airspace infringement

Develop and implement a pan-EUR region Safety Promotion campaign on preventing airspace infringement and reducing the risk of MAC including awareness of airspace complexity and the use of technology that identifies and shares aircraft position with traffic and air navigation service providers.

MONITORING	
Monitoring activities	**Related SPIs**
Monitoring percentage of accidents in this key risk areas	*EUR.SPI.1.1.04*

---

18   Although there have been no CAT aeroplane airborne collision accidents in recent years within the EASA Member States, this key risk area has been raised by a number of Member States through the NoAs and also by some airlines, specifically in the context of the collision risk posed by aircraft without transponders in uncontrolled airspace. For EASA Member States airborne collision is the key risk area ranking highest with regard to its cumulative risk score (see ASR 2021) related to fatal accidents in CAT aeroplane and NCC operations

EUR.SPT.0098	Reinforce the appropriate reactions of flight crew in response to an ACAS resolution advisory (RA)

Help to mitigate the risk of mid-air collision by providing safety promotion material and clear messages to pilots on the need to follow the instructions of the ACAS in high-risk situations.

States may make use of material developed by EASA and EUROCONTROL.

EUR.SPT.0034	'Due regard' for the safety of civil traffic

States must have due regard for the safety of civil aircraft and must have established respective regulations for national State aircraft.

Several States have reported an increase in losses of separation involving civil and military aircraft and more particularly and more particularly an increase in non-cooperative international military traffic.

The States should consider implementation of the following recommendations :
— endorse and fully apply ICAO Manual on Civil-Military Cooperation in Air Traffic Management (Doc 10088);
— closely coordinate to develop, harmonise and publish operational requirements and instructions for state aircraft to ensure that 'due regard' for civil aircraft is always maintained;
— support the development and harmonisation of civil/military coordination procedures for ATM at EUR level and beyond if possible;
— report relevant occurrences to the authorities ; and
— facilitate/make primary surveillance radar data available in military units to civil ATC centres to civil ATC units.

The States are called to follow-up on the recommendations and provide feedback on the implementation.

5.3.1.4 Terrain collision

This risk area includes the controlled collision with terrain together with undershoot or overshoot of the runway during approach and landing phases. It comprises those situations where the aircraft collides or nearly collides with terrain while the flight crew has control of the aircraft. It also includes occurrences which are the direct precursors of a fatal outcome, such as descending below weather minima, undue clearance below radar minima, etc.

EUR.RMT.0035	TAWS operation in IFR and VFR and TAWS for turbine-powered aeroplanes under 5 700 kg MTOM able to carry six to nine passengers

Develop a regulatory framework for:

— mitigation of the risks of accidents categorised as CFIT in turbine-powered aeroplanes having a maximum certified take-off mass (MCTOM) below 5 700 kg or a maximum operational passenger seating configuration (MOPSC) of more than five and not more than nine; and

— improvement of the terrain awareness warning system (TAWS) efficiency in reducing CFIT accidents.

5.3.1.5 Fire, smoke, pressurisation and cabin air quality

Uncontrolled fire on board an aircraft, especially when in flight, represents one of the most severe hazards in aviation. Aircraft depressurisations and post-crash fire are also addressed in this section, which looks at situations where the internal environment of the aircraft may become hazardous or even un-survivable.

In-flight fire can ultimately lead to loss of control, either as a result of structural or control system failure, or again as a result of crew incapacitation. Fire on the ground can take hold rapidly and lead to significant casualties if evacuation and emergency response is not swift enough. Smoke or fumes, whether they are associated with fire or not, can lead to passenger and crew incapacitation and will certainly raise concern and invite a response. Even when they do not give rise to a safety impact, they can give rise to concerns and need to be addressed.

While there were no fatal accidents involving EASA Member States' operators in the last years related to fires, there have been occurrences in other parts of the world that make it an area of concern within EPAS.

The issue of cabin air quality (CAQ) on board commercial aircraft is the subject of several investigations and research projects worldwide regarding the health and safety implications for crews and passengers.

Although representing a small proportion of CAQ events, contaminations by oil or aircraft fluids and their by-products are those that raise the utmost concerns.

EUR.SPT.101	**Promote awareness of the risks associated with the carriage of misdeclared/undeclared lithium batteries in the cargo compartment and encourage the proactive implementation of robust controls.**
	Promote a common understanding of the risks associated with the international carriage of misdeclared/undeclared lithium batteries by exchanging qualitative and quantitative intelligence between states and encourage the industry implementation of robust risk mitigations.

5.3.2 Aerial work/Specialised operations (SPO) - aeroplanes

NB: For aerial work/SPO rotorcraft helicopters, please refer to Chapter 5.4.

According to EASA data in 2021 the numbers of accidents and serious incidents were equal or lower than the average of the preceding decade for all operation types. In 2021, 10 out of the 14 accidents and serious incidents were in parachuting operations and sailplane towing operations. There were only two accidents in agricultural operations and one accident in airshow/race in 2021.

There were no accidents or serious incidents in aerial advertising, aerial observation, animal herding/mustering, or calibration operations.

As concerns key risk areas for specialised operations involving aeroplanes it can be observed that aircraft upset is the most likely type of accident which accidents and serious incidents have (resp. might have) escalated to. Aircraft upset also presents the highest risk in this domain. In 2021 there have been approximately 35 occurrences where excursion is the key risk area, however aggregated ERCS risk score of these accidents and serious incidents is lower than, for example, the risk score of terrain collision or airborne collision (cf. ASR 2022).

Based on the analysis of accident and serious incident data by EASA, system reliability is the safety issue with the highest aggregated ERCS score. Besides system reliability, perception and situational awareness along with flight planning and preparation are the safety issues that affect the most key risk areas. The top three KRAs for aeroplane SPO are indicated below:

Specialised operations - aeroplanes

KRA 1	KRA 2	KRA 3
Aircraft upset	Terrain collision	Airborne collision

The highest-risk safety issues in this domain all relate to system reliability, followed by intentional low flying and flight planning & preparation.

EUR.SPT.0088	Improving the safety of parachuting operations (General Aviation – Aerial Work)

Launch a safety promotion campaign to improve the safety of parachuting aircraft operations by both highlighting the most common causes of accidents in this domain and providing good practices/ operational procedures that can help to mitigate the most important risks.

Make use of EASA Safety Promotion material that will become available in 2023.

5.4 Flight operations – rotorcraft

This chapter groups all actions in the area of rotorcraft operations.

Rotorcraft operators perform a wide range of highly specialised operations that are important for the European economy and citizens. There is a need to further develop towards an efficient regulatory framework, considering technological advancements.

This area includes three types of operations involving certified helicopters:

- Commercial air transport (CAT) operations, passenger and cargo conducted by ICAO EUR States' AOC holders, including passenger and cargo flights to and from offshore oil and gas installations in CAT;

- Aerial work (specialized operations (SPO)), such as advertisement, photography, with an ICAO EUR State as the State of operator or State of registry; and

- non-commercial operations with helicopters registered in an ICAO EUR State or for which an ICAO EUR State is the State of operator; this section includes in particular training flights.

The top three key risk areas for each of the three types of operation are as follows (cf. EASA Annual Safety Review 2022):

CAT operations helicopters

KRA 1	KRA 2	KRA 3
Airborne collission	Obstacle collision in flight	Aircraft upset

Based on the analysis of European occurrence data, in CAT the inadequate airborne separation under VFR operation is the safety issue with the highest aggregated risk score and is a very strong contributor to the airborne collision outcome. The inadequate obstacle clearance during low-altitude operation, take-off and landing is the second top safety issue which contributed frequently to the key risk areas obstacle collision in flight, aircraft upset and terrain collision.

SPO helicopters (aerial work)

KRA 1	KRA 2	KRA 3
Aircraft upset	Obstacle collision in flight	Other injuries

Based on the analysis of European occurrence data, engine power loss in flight is the safety issue with the highest aggregated risk score and is a very strong contributor to the aircraft upset accident outcome. Engine power losses and the subsequent issues with aircraft handling following this type of failure caused 8 accidents over the last 5 years, 2 of them with a fatal outcome.

The inadequate obstacle clearance during low-altitude operation, take-off and landing is the second highest safety issue, which contributed in particular to the key risk area obstacle collision in flight. This safety issue was frequently identified in the case of collisions with power lines during take-off, landing and low altitude operations.

Non-commercial operations (NCO) helicopters

KRA 1	KRA 2	KRA 3
Aircraft upset	Obstacle collision in flight	Terrain collision

Based on the analysis of European occurrence data,, the inadequate obstacle clearance during low-altitude operation, take-off and landing is the safety issue with the highest aggregated risk score and is strongly contributes to obstacle collision in flight outcome.

For the top key risk area aircraft upset, the safety issues contributing the most frequently to this outcome are the unanticipated yaw / loss of tail rotor effectiveness, the dynamic rollovers and the engine loss of power in flight.

In the particular case of training flights, the inadequate handling of simulated technical failures and abnormal procedures such as autorotation trainings are a clear indication that high risk training manoeuvres are a cause of concern.

EUR.RMT.0050	Single-engine helicopter operations

Review the applicable regulations and guidance material in order to re-evaluate:

— Restrictions on piston engine helicopters to operate over hostile environment;
— Restrictions on single-engine helicopters to operate over congested environment.

[20] Opinion No 08/2022 - Helicopter emergency medical service performance and public interest sites | EASA (europa.eu)

EUR.RMT.0052	Controlled flight into terrain (CFIT) prevention with helicopter terrain avoidance warning systems (HTAWS)

Mandating HTAWS is expected to prevent between 8.5 and 11.5 CFIT accidents with fatalities or severe injuries within 10 years (medium safety improvement)[21]. This task will consider mandating the installation of HTAWS on board the helicopter for certain operations. This should only mandate HTAWS to be retrofitted to the current fleet if HTAWS standards are improved.

An appropriate impact assessment for retrofit will need to be further developed. The cost effectiveness analysis should be performed to identify operations that should not to be considered for the mandate.

5.5   Flight operations - General Aviation/leisure flying

This Chapter covers GA non-commercial operations involving aeroplanes with MTOMs below 5 700 kg, as well as all operations with balloons and sailplanes.

GA in Europe is maintaining a stable activity involving 10 times more aircraft and airfields than CAT. GA has been since its origin the cradle for innovation and recruitment of young professionals (ATCOs, mechanics, pilots, etc.) and a means to connect people across Europe.

Addressing safety risks in GA in a proportionate and effective manner is a strategic priority.

According to EASA data between 2011 and 2020, accidents in Europe involving **recreational aeroplanes**, i.e. non-commercially operated small aeroplanes with MTOMs below 5 700 kg, led to between 70 and 115 fatalities per year, with an average of 88.1 fatalities per year. These figures exclude fatal accidents involving micro light airplanes, gliders and balloons. As such, this sector of aviation has the highest average number of fatalities per year. In 2021, there were 58 fatal accidents causing 96 fatalities involving recreational aeroplanes. 2021 shows an increase in both the number of fatal accidents and non-fatal accidents compared to the 10-year average. The number of serious incidents (186) also significantly increased in comparison with the 10-year average (115.4). There were 48 serious injuries, well above the 10-year average of 42.4. In terms of accident rates, based on data provided by GAMA/AOPA in 2022, both the numbers of flights and flight hours have slightly increased since 2020. The fatal accident rate is slightly higher in 2021 (3.1 in 2020 and 3.3 in 2021[22]). However, the non-fatal accident rate in 2021 increased by 4%.

There were 17 fatalities in **sailplane operations in** 2021. This is a significant decrease when compared to the 10-year average (29.9). The number of serious incidents (32) is however above the 10-year average (22.7). The number of serious injuries (22) remains below the 10-year average (33.8) . Compared to the 10-year average, the number of fatalities were reduced by 43% and the number of serious injuries by 35%. In terms of accident rates, based on the annual GAMA/AOPA survey, in 2021 the number of flights is estimated to have increased by 4% from the previous year so the fatal accident and non-fatal accident rates are both decreasing (fatal accident rate down from 1.2 in 2020 to 0.7 in 2021, non-fatal accident rate down from 8.2 in 2020 to 6.4 in 2021[59]).

As concerns **balloon operations**, in 2021 there were 2 fatal accidents resulting in 2 fatalities, 14 non-fatal accidents and no serious incidents recorded. The fatal accident figure is above the 10-year average (1.4), the non-fatal accident figure (14) is similar to that average (15.0).

The ASR 2022 provides further insights into safety in GA, including key statistics, accident rates, key risk areas and safety issues associated with non-commercially operated small aeroplanes (refer to Section 2.5), sailplanes (refer to Chapter 5) and balloons (refer to Chapter 4) respectively. Safety issues pertaining to non-commercially operated small aeroplanes are further described in EPAS Volume III.

The persisting high number of fatalities in GA accidents shows that further efforts are required to mitigate risks leading to those fatalities. The European Safety Risk Management process identified following top three KRAs in non-commercially operated small aeroplanes (MTOMs below 5 700 kg):

KRA 1	KRA 2	KRA 3
Aircraft upset	Terrain collision	Airborne collission

---

[22]   accidents per 100.000 flights

For sailplanes, the top three KRAs are indicated below:

KRA 1	KRA 2	KRA 3
Aircraft upset	Terrain collision	Obstacle collision in flight

The top three KRAs in balloon operations are as follows:

KRA 1	KRA 2	KRA 3
Obstacle collision in flight	Balloon landings	Aircraft upset

5.5.1 Systemic enablers

This section addresses system-wide or transversal issues that affect GA as a whole and/or that are common to several safety risk areas. In combination with triggering factors, transversal factors can play a significant role in incidents and accidents. Conversely, they also offer opportunities for improving safety across risk domains.

EUR.SPT.0058	Operational rules for sailplanes and balloons

Establish a set of rules covering Air Operations with sailplanes and balloons as the only regulatory reference for such operations, which addresses the specificities and associated risks in an efficient and proportional manner

5.5.2   Staying in control

This section addresses subjects such as flying skills, pilot awareness and the management of upset or stall at take-off, in flight, or during approach and landing, flight preparation, aborting take-off and going around. Staying in control prevents loss of control accidents. Loss of control usually occurs because the aeroplane enters a flight regime outside its normal envelope, thereby introducing an element of surprise for the flight crew involved. Loss of control accidents are both frequent and severe.

EUR.SPT.0063	Campaign on staying in control

Launch a campaign on staying in control covering topics such as aircraft performance, flight preparation and management, role of angle of attack, Threat and error management (TEM), upset and stall avoidance and recovery, and startle and surprise management.

The following Safety Promotion deliverables are available on the EASA website:
• Loss of Control (LOC-I)
• Loss of Control (LOC-I) in Approach and Landing
• Loss of Control (LOC-I) at Take-Off
• Crosswind final turn

5.5.3 Coping with weather

This section addresses subjects such as entering IMC, icing conditions, carburettor icing, and poor weather conditions. Weather is an important contributing factor to GA accidents, often related to pilots underestimating the risks of changing weather conditions prior to take-off and during the flight, as weather deteriorates. Dealing with poor weather may increase pilot workload and affect situational awareness and aircraft handling. Decision-making can also be impaired, as a plan continuation bias may lead pilots to press on to the planned destination despite threatening weather conditions.

EUR.SPT.0064	Weather awareness for pilots

Produce safety promotion material (video) addressing subjects such as weather awareness, flight preparation, management and debrief, the use of flight information services (FIS), the benefits of using modern technology including cockpit weather information systems (including GPS integrated, mobile/4G connected apps, etc.), communication with ATC, inadvertent entry into IMC, TEM, and Human Factors (HF).

5.5.4   Preventing mid-air collisions

This section addresses subjects such as airspace complexity, airspace infringement and use of technology. Statistics show that MAC risks affect both novice and experienced pilots and can occur in all phases of flight and at all altitudes. However, the vast majority of them occur in daylight and in excellent meteorological conditions. A collision is more likely where aircraft are concentrated, especially close to aerodromes. Airspace infringements by GA aircraft into controlled airspace is an important related safety risk.

The section is maintained as a placeholder for future actions.

5.5.5   Managing the flight

This section addresses subjects such as navigation, fuel management, terrain and obstacle awareness, and forced landings. Most accidents are the result of the pilot's actions, including decisions made while preparing the flight, or due to changing circumstances during the flight. Pilot decisions, including their ability to prioritise workload, affect safety of the aircraft and survival of its occupants.

EUR.SPT.0066	Fuel management for pilots

Compile and disseminate to the community available material on fuel management.

EUR.SPT.0093	Promote iConspicuity (General Aviation)

iConspicuity (or in-flight electronic conspicuity plus) is defined as in-flight capability to transmit position of aircraft and/or to receive, process and display positions of other aircraft in a real time with the objective to enhance pilots' situational awareness about surrounding traffic. This includes a range of technologies and solutions, whether airborne or on the ground, that can help airspace users and other affected stakeholders to be more aware of other aircraft in their vicinity or in a given airspace.

Technological developments in the area of non-certified anti-collision and traffic awareness devices/systems hold potential to significantly reduce the airborne collision risk involving uncontrolled traffic. These systems are however not mutually compatible.

The installation of iConspicuity devices in all EUR/NAT registered General Aviation aircraft should be facilitated and their use by airspace users promoted at an affordable cost.

The objective of this action is to support initiatives enhancing interoperability of iConspicuity devices/systems, making use of EASA safety promotion material and monitoring the outcome of related EASA Research Projects (refer to EPAS actions RES.0021, RES.0031 and RES.0032 introduced with the EPAS 2020-2024 edition).

5.6 Design and production

This chapter includes all the actions that are relevant to design and production.

Design and production improvements may limit the probability and/or severity of technical failures. Many fatal accidents involve some sort of technical failure, in many cases not properly managed during flight, thus making it a precursor of other types of accident. This does not necessarily mean that the technical failure was the direct cause of the accident, but that a system component failure was identified in the sequence of events in a number of serious incidents and accidents over the past years. Handling of technical failures in this context means the ineffective handling of a non-catastrophic technical failure by the flight crew. This could be an engine failure, an avionics system failure or some other recoverable technical failure. The cause of the accident is usually the result of a combination of circumstances and events that can only be understood after reading the investigation report.

EUR.RMT.0067	Reduction of runway excursions

The objective of this task is to increase the level of safety by reducing the number of REs through mandating existing technologies on aeroplane that allow to measure remaining runway left and thus support pilot-decision-making. Put more emphasis on safety objectives against the risk of REs, while providing more flexibility in terms of design solutions. The means to achieve these objectives will be provided in a technical standard developed jointly by industry and CAAs with the support of an international standardisation bodies (like EUROCAE).

Status	*ongoing*

5.7 Maintenance and continuing airworthiness management

This chapter includes all the actions that are relevant to maintenance and continuing airworthiness management.

Like in the case of design and manufacture improvements, maintenance improvements may limit the probability and/or severity of technical failures. Many fatal accidents involve some sort of technical failure, in many cases not properly managed during flight, thus making it a precursor of other types of accident. This does not necessarily mean that the technical failure was the direct cause of the accident, but that a system component failure was identified in the sequence of events in a number of serious incidents and accidents over the past years. Handling of technical failures in this context means the ineffective handling of a non-catastrophic technical failure by the flight crew. This could be an engine failure, an avionics system failure or some other recoverable technical failure. The cause of the accident is usually the result of a combination of circumstances and events that can only be understood after reading the investigation report.

Certain existing requirements are either not efficient or not proportionate to the risks involved.

EUR.RMT.0068	Functions and responsibilities of maintenance certifying staff and support staff

Introduce principles for increased robustness of the maintenance certification process eliminating potential 'safety gaps' by clarifying the roles and responsibilities of certifying staff, support staff and 'sign-off' staff, both in line and base maintenance.

5.8 Air traffic management/air navigation services

There is still a lack of harmonised rules based on ICAO SARPs in order to ensure compliance with the essential requirements that apply to ATM/ANS. Rules must ensure that ATM/ANS systems and their constituents are successfully designed, manufactured and installed. If not, the achievement of the overall objectives of ATM/ANS may be compromised.

This may entail the inclusion of additional requirements concerning flight procedure design, ATS, AIS/AIM. Safe and cost-effective ATM/ANS provision also needs to ensure harmonised conformity assessment of their supporting systems and constituents, so that the equipment involved performs as expected during the intended operation. Implementation issues associated with ATM/ANS systems and constituents should also be addressed, especially those related to lack of interoperability and performance that may have an impact on operations.

The European Safety Risk Management process identified following top three KRAs for ATM/ANS.

KRA 1	KRA 2	KRA 3
Airborne collision	Collision on runway	Runway excursion

EUR.RMT.0072	Technical requirements and operating procedures for airspace design, including flight procedure design

Development of the necessary organisational and technical requirements on airspace design. Basically, the scope of the task is to establish the requirements for the design of flight procedures and ATS routes, to support the implementation of PBN operations and evaluate the need for extension to other airspace structures and flight procedure design. This will include an analysis of the need to include procedures for airspace design in the ATM/ANS certification scheme.

5.9   Aerodrome operations and ground handling

This Chapter addresses aerodrome design and operations, as well as aerodrome operators and all ground handling related aspects. These risk areas includes all ground handling and apron management-related issues (aircraft loading, de-icing, refuelling, ground damage, etc.) as well as collision of the aircraft with other aircraft, obstacles or vehicles while the aircraft is moving on the ground, either under its own power or being towed. It does not include collisions on the runway.

Actions in this Chapter address safety in terms of developing and maintaining a legal framework commensurate with the complexity of ADR activities and management of potential risks. Further actions in this Chapter aim at ensuring compliance with the ICAO SAPRs and a harmonised approach which will support the free movement of services within the EUR NAT States.

The European Safety Risk Management process identified following top three KRAs for Aerodromes and ground handling:

KRA 1	KRA 2	KRA 3
Aircraft upset	Ground damage	Fire, Smoke, Pressurisation

EUR.RMT.0077*	Certification requirements for VFR heliports located at the international aerodromes

Ensure a high uniform level of safety at aerodromes aligning applicable regulations with ICAO Annex 14, Volume II, Heliports; develop necessary certification standards and guidance material for design and, if necessary, for operation and oversight of visual flight rules (VFR) heliports co-located at the international aerodromes.

EUR.SPT.0095*	Counter-UAS measures and UAS incident management at aerodromes

States should support the aerodrome operators, ATS providers and aircraft operators in preventing and managing incidents of unauthorised UAS operations in the vicinity of aerodromes, while at the same time keeping operational disruptions at a minimum.

EASA is acting as the European coordinator of the Counter Drones (C-UAS) Action Plan, with the five objectives to deliver safety promotion and guidance material to educate the public and raise awareness to reduce the misuse of UAS around the aerodromes, to prepare the aerodromes to mitigate such risks, to assess the safety risks amd ensure that the C-UAS measurea are swiftly considered from a global safety perspective and to ensure an adequate occurrence reporting.

The following material has been already delivered:

5.10 Unmanned aircraft systems (UAS)

This chapter includes all the actions that are relevant to ensure the safe integration of civil unmanned aircraft systems into the aviation system, while enabling standardised UAS operations as well as more complex operations of UAS such as operations in an urban environment (e.g. urban air mobility).

In order to ensure safe UAS operations, it is extremely important to manage the safe integration of UASs into the airspace. European stakeholders are developing rules for what is named U-space[25]. U-space is a set of new services and specific procedures designed to support the safe, efficient and secure access to airspace for large numbers of drones.[26]

EUR.RMT.0083	Introduction of a regulatory framework for the operation of drones

Development of regulatory framework for the three categories of RPAS defined:

— Open category: Low-risk operation not requiring authorisation or declaration before flight

— Specific operation category: Medium-risk operation requiring authorisation or declaration before flight

— Certified category: High-risk operation requiring certification process

Development of adequate rules to enable U-space implementation

Status	*ongoing*

5.11 New technologies and concepts

This Chapter addresses the safe integration of new technologies and innovative solutions into the aviation system, with the exception of civil drones, which are addressed in the previous Chapter. While many of the technologies and innovations emerging in the aviation industry bear significant potential to further improve the level of safety and/or efficiency, the EUR RASP must give due consideration to the safety issues deriving from new technologies, new operational concepts or novel business models[29].

5.11.1   New business models

This section addresses risks related to new and emerging business models arising from the increased complexity of the aviation industry, the number of interfaces between organisations, their contracted services and regulators. Some new business models are emerging: the increased demand for flying in the cities, urban air mobility; the increased digitalisation in aviation systems, the introduction of more autonomous vehicles, platforms starting for single-pilot operations and completely autonomous cargo aircraft. These will challenge the way authorities regulate and oversee the aviation system. CAAs should work better together and should evaluate, as part of their SSP, whether the existing safety regulatory system adequately addresses current and future safety risks arising from new and emerging business models. This may concern in particular air operator certificate holders' emerging 'new' business models, to identify related safety risks posed to the aviation system.

[29]   In the ATM domain, for For EASA Member States the SESAR covers the development of new technologies for a better management of Europe's airspace as well as their contribution to the achievement of the SES goals and safety targets.

5.11.2   New products, systems, technologies and operations

This section addresses the introduction of new designs, technologies or types of operation for which regulatory updates are needed, and highlights some of the most relevant trends that will influence aviation in the years to come.

EUR.RMT.0086	New air mobility

Current regulatory frameworks for aviation safety were initially designed for conventional fixed wing aircraft, rotorcraft, balloons and sailplanes. The existing frameworks rely on active contribution of human beings, increasingly assisted by automation, be it on board or on the ground. Propulsion is mostly provided by piston or turbine engines using fossil fuels. The introduction of new technologies and air transport concepts (from multi-modal vehicles to autonomous vehicles) requires revisiting those frameworks, e.g. to to cater for the new role of the human in the system or allow the safe integration of electric/hybrid propulsion systems.

The purpose of this RMT is to develop rules or amend existing ones, where necessary, to address new technologies and operational air transport concepts, with the objective of adapting the regulatory framework. A general principle that should govern related rulemaking is that future requirements should be technology-neutral where possible, while ensuring legal certainty.

5.11.3 All-weather operations (AWOs)

AWOs are typically addressed by regulations in the following aviation domains: airworthiness, air operations, aircrew, aerodromes, ATM/ANS as well as in rules of the air. The existing rules in these domains may not be sufficiently addressing technological advancements, or not yet fully align with the ICAO SARPs (e.g. ICAO Annex 6 amendments introducing lower category (CAT) II and CAT III minima and the concept of operational credits, in particular for operations with vision systems). Rulemaking in this area will increase consistency of rules across different domains, encourage cross-domain risk assessments, ensure that better weather information is provided to pilots, as well as harmonise with the FAA and other regulators.

EUR.RMT.0087	All Weather Operations

Review and update the all-weather operations (AWO) rules in all aviation domains, as regards:

— *possibility of applying safety performance principle in redrafting of current rules with the aim of allowing a better integration of new and future technologies supporting AWO operations, as e.g. enhanced flight vision systems (EFVS), synthetic vision systems (SVS), synthetic vision guidance systems (SVGS), combined vision systems (CVS), head-up displays (HUD);*

— *conventional low visibility operations (LVO), such as instrument landing system (ILS)-based CAT II and CAT III approach operations or low visibility take-offs;*

— *other than AWO, such as CAT I operations using ILS, GLS or SBAS, or approach operations to higher minima using area navigation (RNAV)(GNSS), non-directional beacons (NDBs) or VHF omnidirectional ranges (VORs);*

— *miscellaneous items, such as the improvement of existing rules text and the transposition of the new ICAO approach classification;*

— *harmonisation with bilateral partners (e.g. FAA) to the extent possible;*

— *introduction of operations with operational credits not being yet part of ICAO regulatory system.*

ADS-B	automatic dependent surveillance - broadcast
AI	artificial intelligence
AIM	aeronautical information management
AIR	air navigation services
AIS	aeronautical information services
AMC	acceptable means of compliance
AML	aircraft maintenance licence
AMO	approved maintenance organisation
AMTO	approved maintenance training organisation (EASA Part-147)
ANS	air navigation services
AN Region – EUR	Air Navigation Region Europe. It includes 55 out of the 56 Contracting States to which the ICAO EUR/NAT Office is accredited.
AOC	air operator certificate
ASR	annual safety review
ATC	air traffic control
ATCO	air traffic controller
ATM	air traffic management
ATO	approved training organisation
ATPL	air transport pilot licence
ATSs	air traffic services
ATSEP	air traffic safety electronics personnel
AWOs	all-weather operations
CAA(s)	civil aviation authority(s)
CAG	Collaborative Analysis Group
CANSO	Civil Air Navigation Services Organization
CAPP	Certification Authorities for Propulsion
CAPs	corrective action plans
CAQ	cabin air quality
CAT	commercial air transport
CAT I, II, III	category I, II, III
CATA	Certification Authorities for Transport Airplane

CBT	computer based training
CBTA	competency-based training and assessment
CE	Critical Element
CE-6	Critical Element 6: Licensing, certification, authorisation and/or approval obligations
CE-7	Critical Element 7: Surveillance obligations
CE-8	Critical Element 8: Resolution of safety concerns
CFIT	controlled flight into terrain
CMT	Certification Management Team
CPL	commercial pilot licence
CRM	crew resource management
C-UAS	Counter Unmanned Aircraft Systems
CVS	combined vision systems
D&A	drug and alcohol testing
EACTB	Engine Aircraft Certification Tracking Board, under the CMT
EACWG	Engine/Aircraft Certification Working Group (EACWG), initiated by EASA and FAA
EANPG	European Air Navigation Planning Group
EAPAIRR	European Action Plan for Airspace Infringement Risk Reduction
EASP	European Aviation Safety Programme
EASPG	European Aviation System Planning Group
EC	European Commission
ECAC	EASA European Civil Aviation Conference
ECR	European Central Repository
ED Decision	EASA Executive Director Decision
EDTO	extended diversion time operation
EFB	electronic Flight Bag
EFVS	enhanced flight vision systems
EHEST	European Helicopter Safety Team
EI	Effective Implementation
ELP	English Language Proficiency
EMS	emergency medical services
EOFDM	European Operators Flight Data Monitoring forum
EPAS	European Plan for Aviation Safety
ERCS	European Risk Classification Scheme
ESCP	European Strategic Coordination Platform
ESPN-R	European Safety Promotion Network Rotorcraft (previously EHEST)
e-TOD	Electronic Terrain and Obstacle Data

ETOPS	extended-range twin-engine operational performance standards
EU	European Union
EUR region	ICAO region Europe (55 States)
EUROCAE	European Organisation for Civil Aviation Equipment
FAA	United States Federal Aviation Administration
FCOM	flight crew operating manual
FDA	flight data analysis (ICAO)
FDM	flight data monitoring (EASA)
FEM	flight examiner manual
FIS	flight information services
FRM	fatigue risk management
FRMS	fatigue risk management system
FSTDs	flight synthetic training device
FTL	flight time limitation
FTS	fuel tank safety
FUA	Flexible Use of Airspace
GA	General Aviation/leisure flying
GANP	Global Air Navigation Plan
GAPPRE	Global Action Plan for the Prevention of Runway Excursions
GAPPRI	Global Action Plan for the Prevention of Runway Incursions
GASeP	Global Aviation Security Plan
GASP	Global Aviation Safety Plan (ICAO)
GH	Groundhandling
GLS	GBAS (ground-based augmentation system) landing system
GM	guidance material
GNSS	global navigation satellite system
GPS	global positioning system
HEMS	helicopter emergency medical services
HF	human factors
HF CAG	Human Factors Collaborative Analysis Group
HP	human performance
HTAWS	helicopter terrain awareness warning systems
HUD	head-up display
ICAO	International Civil Aviation Organization
IE-FDG	ICAO EUR - Flight Data Analysis and Air Operator Safety Management System Group
IE-HOST	ICAO EUR - Helicopter Operations Safety Team

IE-REST	Former ICAO EUR - Regional Expert Safety Team
IFR	instrument flight rules
IFTSS	individual flight time specification scheme
IHST	International Helicopter Safety Team
ILS	instrument landing system
IMC	instrument meteorological conditions
INF	information management (in reflection to ATM Master Plan Level 3)
IR	(European Commission) implementing rule
IR	instrument rating
ITY	interoperability (in reflection to ATM Master Plan Level 3)
ITY-ADQ	Ensure Quality of Aeronautical Data and Aeronautical Information
KRA	Key Risk Area
LAPL	Light Aircraft Pilot Licence
LOCART	loss of control avoidance and recovery training
LOC-I	loss of control – in-flight
LPRI	Language Proficiency Requirements Implementation
LVO	low-visibility operation
MAC	mid-air collision
MCTOM	Maximum Certified Take-off Mass
ML	Machine Learning (artificial intelligence)
MO	maintenance organisation
MOPSC	maximum operational passenger seating configuration
MPL	multi-crew pilot licence
MS	Member State
MST	Member States' task
MTOM	maximum take-off mass
NAA	national aviation authority
NASP	National Aviation Safety Plan
NAV	Navigation (in reflection to ATM Master Plan Level 3)
NCC	non-commercial air operations with complex motor-powered aircraft*
NCO	non-commercial air operations with other-than complex motor-powered aircraft*
* The term 'complex motor-powered aircraft' is no longer defined in Regulation (EU) 2018/1139. Article 140(2) of that Regulation provides that no later than 12 September 2023, implementing rules adopted under Regulations (EC) Nos 216/2008 and 552/2004 shall be adapted to the new Basic Regulation. Until then, deleted or altered definitions will continue to apply.	
NDBs	non-directional beacon
NGAP	Next Generation of Aviation Professionals Programme (ICAO)

NoA	Network of Analysts
OPS	air operations
OpSpecs	operations specifications
PANS	procedures for air navigation services (ICAO)
PANS-TRG	Procedures for Air Navigation Services - Training
Part-145	EU Maintenance Organisation Regulation
Part-66	EU Maintenance Certifying Staff Regulation
Part-M	EU Continuing Airworthiness Management Regulation
PBN	performance-based navigation
PBAOM	performance based aerodrome operating minima
PEL	Personnel Licensing
PIS	public interest sites
PPL	Private Pilot Licence
PQ`	Protocol Question (USOAP)
PSCS	Preferred SAR Capability Specifications
RASG	Regional Aviation Safety Group
RASP	Regional Aviation Safety Plan
RE	runway excursion
RFID	radio frequency identification device
RI	runway incursion
RMT	rulemaking task
RNAV	area navigation
RNP	Required Navigation Performance
RPAS	Remotely Piloted Aircraft Systems
RWY	runway
SAF	Safety Management (in reflection to ATM Master Plan Level 3)
SAR	Search and Rescue
SARPs	Standards and Recommended Practices (ICAO)
SBAS	satellite-based augmentation system
SDCPS	safety data collection and processing system (ICAO)
SEI	Safety Enhancement Initiative (ICAO) as defined in GASP
SESAR	Single European Sky ATM Research
SMICG	Safety Management International Collaboration Group
SMS	safety management system
SPAS	State Plan for Aviation Safety
SPI	surveillance performance and interoperability

SPI	safety performance indicator
SPTs	safety promotion task
SR	safety recommendation
SRM	safety risk management
SSP	state safety programme
SSR	secondary surveillance radar
ST	standard (rulemaking) procedure
STC	supplemental type certificate
STDs	synthetic training device
SVGS	synthetic vision guidance system
SVS	synthetic vision system
TAWS	New Terrain Awareness and Warning System
TC	type certificate
TeB	Member State technical body
TEM	threat and error management
TMA	terminal manoeuvring area
TO	training organisation
UAS	unmanned aircraft systems
UK	United Kingdom
UPRT	upset prevention and recovery training
U-space	unmanned traffic management in Europe
USOAP	Universal Safety Oversight Audit Programme (ICAO)
UTM	unmanned traffic management
VAST	Vertical Aviation Safety Team (previously International Helicopter Safety Team – IHST)
VAST	Vertical Aviation Safety Team
VFR	visual flight rules
VHF	very high frequency
VOR	VHF omnidirectional range
VTOL	vertical take-off and landing aircraft

Appendix B: List of EUR RASP Stakeholder designations

Stakeholders EUR-RASP	Stakeholders EPAS	Acronym
Aero-Medical Centres i.a.w. ICAO Annex 1	Aero-Medical Centres	n/a
Operators of certified aerodromes i.a.w. ICAO Annex 14 Vol. 1	Aerodrome Operators	n/a
Aero-Medical Examiners i.a.w. ICAO Annex 1	Aero-Medical Examiners	n/a
Air Operator Certificate Holders i.a.w. ICAO Annex 6	Air Operator Certificate Holders	AOC Holders
Air Traffic Controller Training Organisations i.a.w. ICAO Annex 1	Air Traffic Controller Training Organisations	n/a
Air Traffic Controllers	Air Traffic Controllers	ATCOs
Air Traffic Safety Electronics Personnel	Air Traffic Safety Electronics Personnel	n/a
Aircraft Operators - Balloons	Aircraft Operators - Balloons	n/a
Aircraft Operators - CAT i.a.w. ICAO Annex 6	Aircraft Operators - CAT	n/a
Aircraft Operators - CAT - Aeroplanes i.a.w. ICAO Annex 6 Part I	Aircraft Operators - CAT - Aeroplanes	n/a
Aircraft Operators - CAT - Helicopters i.a.w. ICAO Annex 6 Part III	Aircraft Operators - CAT - Helicopters	n/a
Aircraft Operators - CAT - Helicopters - HEMS i.a.w. ICAO Annex 6 Part III	Aircraft Operators - CAT - Helicopters - HEMS	n/a
Aircraft Operators - CAT - Helicopters - HHO i.a.w. ICAO Annex 6 Part III	Aircraft Operators - CAT - Helicopters - HHO	n/a
Aircraft Operators - CAT - Helicopters - HOFO i.a.w. ICAO Annex 6 Part III	Aircraft Operators - CAT - Helicopters - HOFO	n/a
Aircraft Operators - International General Aviation Operators of large or turbojet aircraft i.a.w. ICAO Annex 6 Part II Section 3	Aircraft Operators - NCC	n/a
Aircraft Operators - International General Aviation Operators of large or turbojet aeroplanes i.a.w. ICAO Annex 6 Part II Section 3	Aircraft Operators - NCC - Aeroplanes	n/a
Aircraft Operators - International General Aviation Operators of large or turbojet helicopters i.a.w. ICAO Annex 6 Part II Section 3	Aircraft Operators - NCC - Helicopters	n/a
Aircraft Operators - other than large or turbojet aircraft, used in non-commercial operations	Aircraft Operators - NCO	n/a
Aircraft Operators - other than large or turbojet aircraft, used in non-commercial operations - Aeroplanes	Aircraft Operators - NCO - Aeroplanes	n/a
Aircraft Operators - other than large or turbojet aircraft, used in non-commercial operations - Helicopters	Aircraft Operators - NCO - Helicopters	n/a
Aircraft Operators - Sailplanes	Aircraft Operators - Sailplanes	n/a
Aircraft Operators - Aerial Work i.a.w. ICAO Annex 6	Aircraft Operators - SPO	n/a
Aircraft Operators - Aerial Work i.a.w. ICAO Annex 6 - Aeroplanes	Aircraft Operators - SPO - Aeroplanes	n/a
Aircraft Operators - Aerial Work i.a.w. ICAO Annex 6 - Helicopters	Aircraft Operators - SPO - Helicopters	n/a
Aircraft Operators - Aerial Work i.a.w. ICAO Annex 6 - Helicopters - HEC	Aircraft Operators - SPO - Helicopters - HEC	n/a
Aircraft Operators - Aerial Work i.a.w. ICAO Annex 6 - Helicopters - HESLO	Aircraft Operators - SPO - Helicopters - HESLO	n/a
Applicants for TC/STC i.a.w. ICAO Annex 8	Applicants for TC/STC	n/a
Applicants for TC/STC i.a.w. ICAO Annex 8	Applicants for TC/STC for large aeroplanes or large rotorcraft	n/a

Stakeholders EUR-RASP	Stakeholders EPAS	Acronym
Approved Pilot Training Organisations i.a.w. ICAO Annex 1	Approved Training Organisations	n/a
Assessors (ATCO) i.a.w. ICAO Annex 1	Assessors (ATCO)	n/a
Cabin Crew i.a.w. ICAO Annex 6 Part I	Cabin Crew	n/a
Competent Aviation Authorities: CAAs used in the EUR RASP	Competent Authorities	CAAs
Organisations responsible for the manufacture of aircraft, engines, propellers or components i.a.w. ICAO Annex 8	POA	n/a
Organisations responsible for the type design of aircraft, engines, propellers or components i.a.w. ICAO Annex 8	Design Organisation Approval Holders	n/a
Examiners (Cabin Crew) i.a.w. ICAO Annex 6 Part I	Examiners (Cabin Crew)	
Examiners (Flight Crew) i.a.w. ICAO Annex 1	Examiners (Flight Crew)	
General Aviation/leisure flying (non-commercial operations)	General Aviation	GA
Groundhandling Service Providers i.a.w. ICAO Annex 9 or Annex 14	Groundhandling Services Providers	n/a
Instructors (ATCO) i.a.w. ICAO Annex 1	Instructors (ATCO)	n/a
Instructors (Cabin Crew) i.a.w. ICAO Annex 6 Part I	Instructors (Cabin Crew)	n/a
Instructors (Flight Crew) i.a.w. ICAO Annex 1	Instructors (Flight Crew)	n/a
Approved Maintenance Organisations	Maintenance Organisations	n/a
Approved Maintenance Training Organisations i.a.w. ICAO Annex 1	Maintenance Training Organisations	n/a
EUR States	Member States	n/a
Military/State Aviation	Military/State Aviation	n/a
Model Aircraft Associations	Model Aircraft Associations	n/a
Operator of an unmanned aircraft	Operator of an unmanned aircraft	n/a
Organisations involved in the design, production and maintenance of safety related aerodrome equipment used or intended for use at aerodromes	Organisations involved in the design, production and maintenance of safety related aerodrome equipment used or intended for use at aerodromes	n/a
Organisations involved in the design, production or maintenance of ATM/ANS systems and ATM/ANS constituents	Organisations involved in the design, production or maintenance of ATM/ANS systems and ATM/ANS constituents	n/a
Organisations involved in unmanned aircraft design, production, maintenance, operations, related services and training	Organisations involved in unmanned aircraft design, production, maintenance, operations, related services and training	n/a
Organisations responsible for provision of apron management services at aerodromes i.a.w. ICAO Annex 14	Organisations responsible for provision of Apron Management Services at aerodromes	n/a

Stakeholders EUR-RASP	Stakeholders EPAS	Acronym
Pilots[30]	Pilots	n/a
Organisations responsible for the manufacture of aircraft, engines, propellers or components i.a.w. ICAO Annex 8	Production Organisation Approval Holders	n/a
Providers of Aeronautical Information Services i.a.w. ICAO Annex 15	Providers of Aeronautical Information Services	AIS Providers
Providers of Air Navigation Services i.a.w. ICAO Annex 11	Providers of Air Navigation Services	ANS Providers
Providers of Air Traffic Control Services i.a.w. ICAO Annex 11	Providers of Air Traffic Control Services	ATC Providers
Providers of Air Traffic Flow Management i.a.w. ICAO Annex 11	Providers of Air Traffic Flow Management	ATFM Providers
Providers of Air Traffic Management i.a.w. ICAO Annex 11	Providers of Air Traffic Management	ATM Providers
Providers of Air Traffic Management/Air Navigation Services i.a.w. ICAO Annex 11	Providers of Air Traffic Management/Air Navigation Services	ATM/ANS Providers
Providers of Air Traffic Services i.a.w. ICAO Annex 11	Providers of Air Traffic Services	ATS Providers
Providers of Airspace Design Services i.a.w. ICAO Annex 8 to Annex 11	Providers of Airspace Design Services	ASD Providers
Providers of Airspace Management i.a.w. ICAO Annex 11 and Annex 2	Providers of Airspace Management	ASM Providers
Providers of Communication, Navigation or Surveillance Services i.a.w. ICAO Annex 10	Providers of Communication, Navigation or Surveillance Services	CNS Providers
Providers of Data Services i.a.w. ICAO Annex 11	Providers of Data Services	DAT Providers
Providers of Meteorological Services i.a.w. ICAO Annex 3	Providers of Meteorological Services	MET Providers
Remote pilots operating an Unmmaned Aircraft System	Remote pilot operating UAS	n/a
Safety Investigation Authorities	Safety Investigation Authorities	SIAs
Student Air Traffic Controllers i.a.w. ICAO Annex 1	Student Air Traffic Controllers	Student ATCOs
Student pilots i.a.w. ICAO Annex 1	Student pilots	n/a
Unmanned Aircraft System Operators	Unmanned Aircraft System Operator	UAS operators

---

[30] Excluding remote pilots operating UAS
