CAIRO - EGYPT

14-18 JUNE 2026

Lessons Learned from Managing Airspace Operations During Regional Geopolitical Disruptions

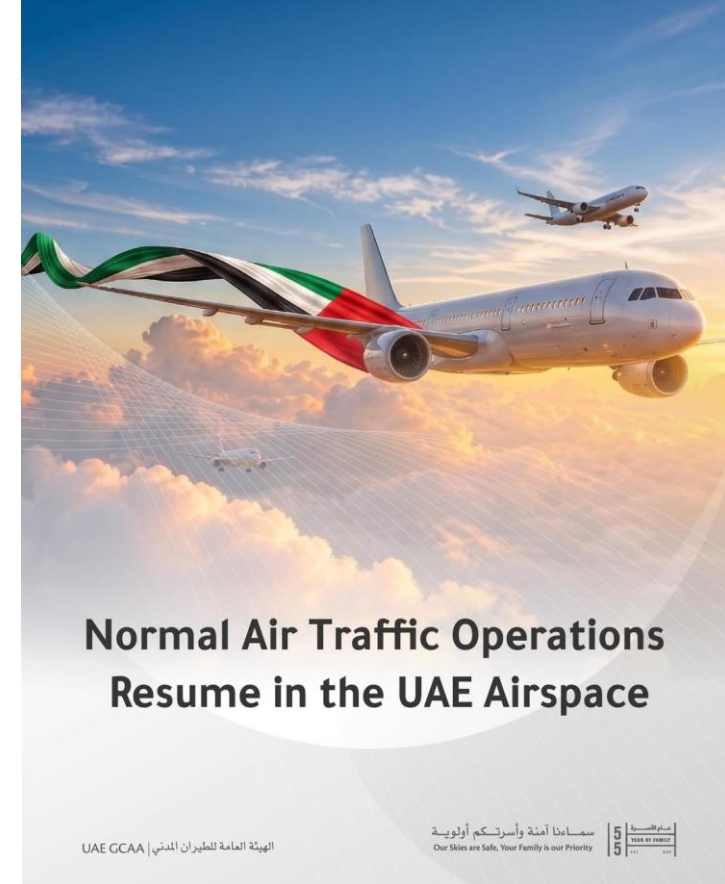

Operational Resilience, Capacity Management, and
Regional Coordination

Presentation Overview

- ❑ Context & Pre-Contingency Preparedness
- ❑ Airspace Closure & Capacity Constraints
- ❑ The Phased Contingency Strategy
- ❑ Route Evolution & Civil-Military Coordination
- ❑ Data-Driven Operations & Sector Redesign
- ❑ Recovery Trajectory & Regional Leadership
- ❑ Key Lessons Learned & Strategic Recommendations

The Geopolitical Context & Preparedness

The Geopolitical Context

- ❑ Building on crucial lessons learned from the previous June 2025 disruptions.
- ❑ Proactive engagement and scenario planning conducted with adjacent units well before February 2026.

Pre-Contingency Preparedness

- ❑ Early notifications dispatched to stakeholders advising heightened vigilance.
- ❑ UAE Airspace Coordination and Contingency Cell (UACACC) activated as the primary platform for real-time operational information.
- ❑ Stakeholders actively refreshed on ESCAT procedures (eAIC 03/2023).
- ❑ Fleet status information collected proactively to anticipate changes

The screenshot shows the UACACC website interface. At the top, there are navigation links: Home, Services, Media Center, Digital Participation, Publications, Open Data, and About GCAA. Below this is a breadcrumb trail: Home > Important Links > UAE Airspace Coordination and Contingency Cell (UACACC). The main header reads "UAE Airspace Coordination and Contingency Cell (UACACC)".

Below the header, there are two main sections:

- OMDB AAR: AMAN terminated due insufficient demand.**
- OMAA AAR: AMAN terminated due insufficient demand.**

The "Zone Departures Stopped" section includes a table with the following data:

	Emirates FIR	OMRK	OMFJ	OMAA	OMDW	OMDB	OMSJ	OMAL
Zone 01 Airport	Departure Stopped	Departure Allowed	Departure Allowed	Departure Allowed	Departure Allowed	Departure Allowed	Departure Allowed	Departure Allowed
Zone 02 Airport	Departure Stopped	Departure Allowed	Departure Allowed	Departure Allowed	Departure Allowed	Departure Allowed	Departure Allowed	Departure Allowed

The "No. of Available parking slots" section includes a table with the following data:

	OMRK	OMFJ	OMAL	OMDW	OMSJ

Air Traffic Flow Management	0	20	3	0	0

UACACC: <https://www.gcaa.gov.ae/en/szc/uacacc>

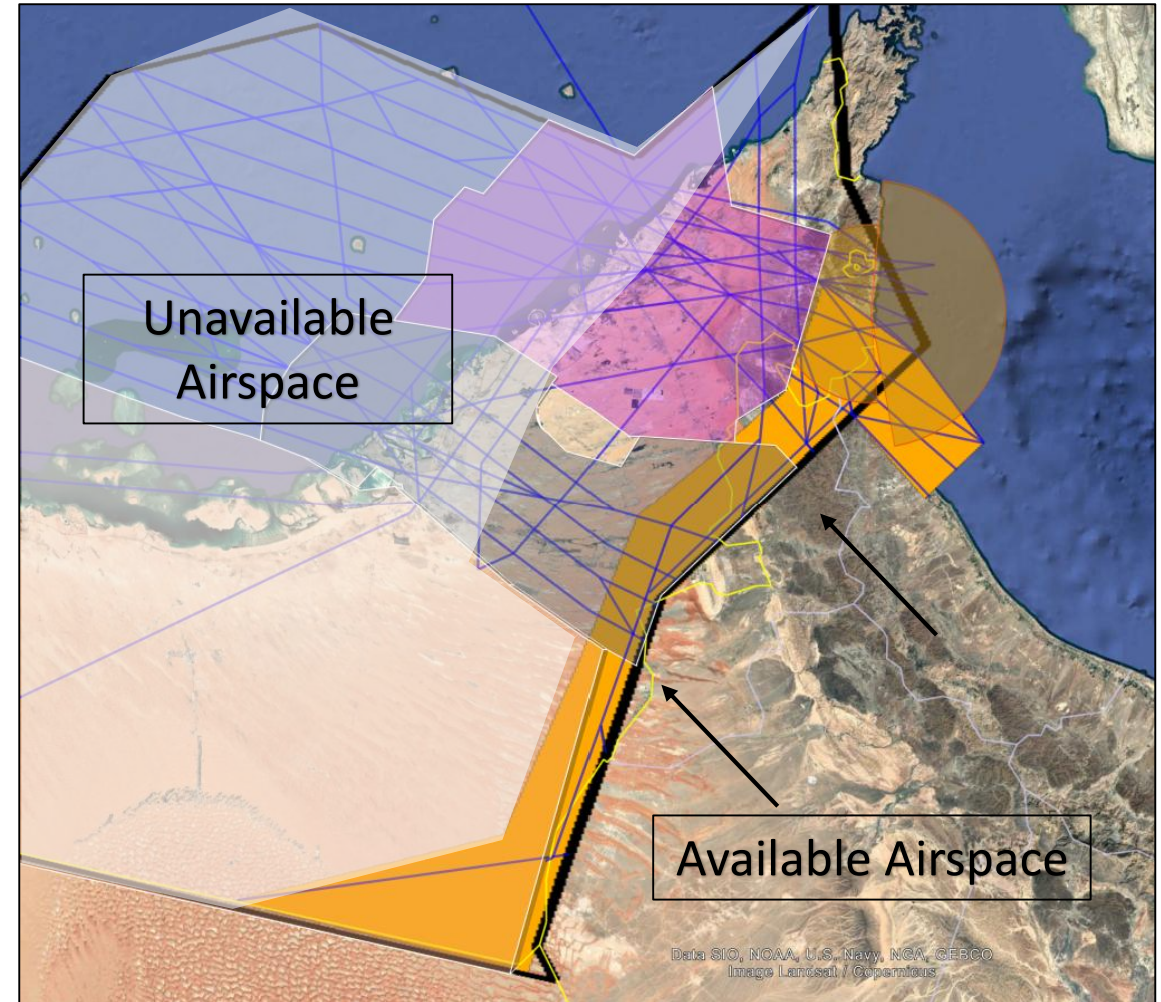

The Airspace Closure & Recovery Sequence

27 Feb	28 Feb	01 Mar	16 Mar	19 Apr
Normal operations (3,078 flights)	Immediate impact (1,238 flights, 60% drop)	Near-zero hour / ESCAT Active (29 flights, 0 overflights)	Contingency routes active (662 flights)	Recovery & Overflights return (1,418 flights)

Operating Under Severe Constraints

- ❑ During the peak contingency, only **11% to 15%** of the total FIR area was available for operations.
- ❑ In the first days, despite this severe limitation, the Emirates FIR successfully handled approximately **33%** of its normal traffic volume in the first days .
- ❑ This highlights the extraordinary efficiency of the civil-military coordination and pre-planned contingency routes.

The Phased Contingency Strategy

Phase 1: Immediate Response

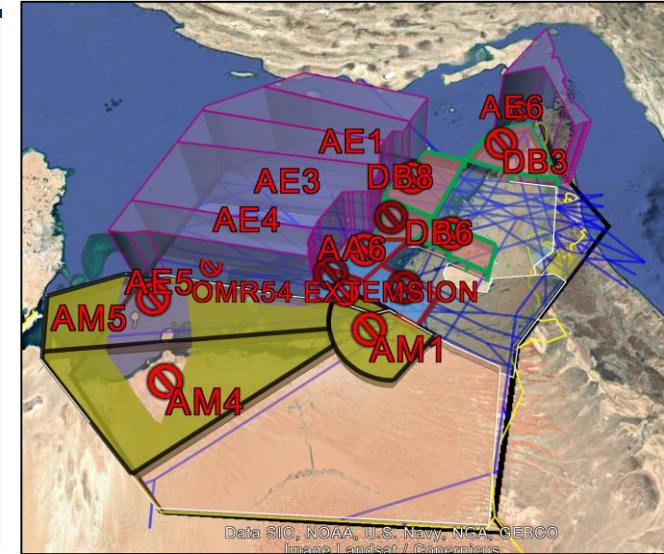

Immediate activation of ESCAT procedures. Severe restriction of airspace to ensure absolute safety during the initial shock of adjacent FIR closures.

Phase 2: Managed Capacity

Implementation of dynamic interval spacing and dynamic flow measures. Opening of restricted corridors based on continuous military threat assessments.

Phase 3: Network Recovery

Gradual expansion of routing options, introduction of contingency holds, and the structured return of overflying traffic as situation stabilized.

Civil-Military Coordination: The Backbone

"Flow measures were dynamic and relied on very close & constant civil-military coordination, escalated or de-escalated depending on military assessments."

- Constant, close coordination with the Ministry of Defence was the foundation of the response.
- Route designs were adapted dynamically to military constraints and real-time threat assessments.
- Safe corridors were identified and maintained between areas of heavy military activity.
- This coordination enabled continued, albeit restricted, operations while preserving absolute safety.

Routes Evolution

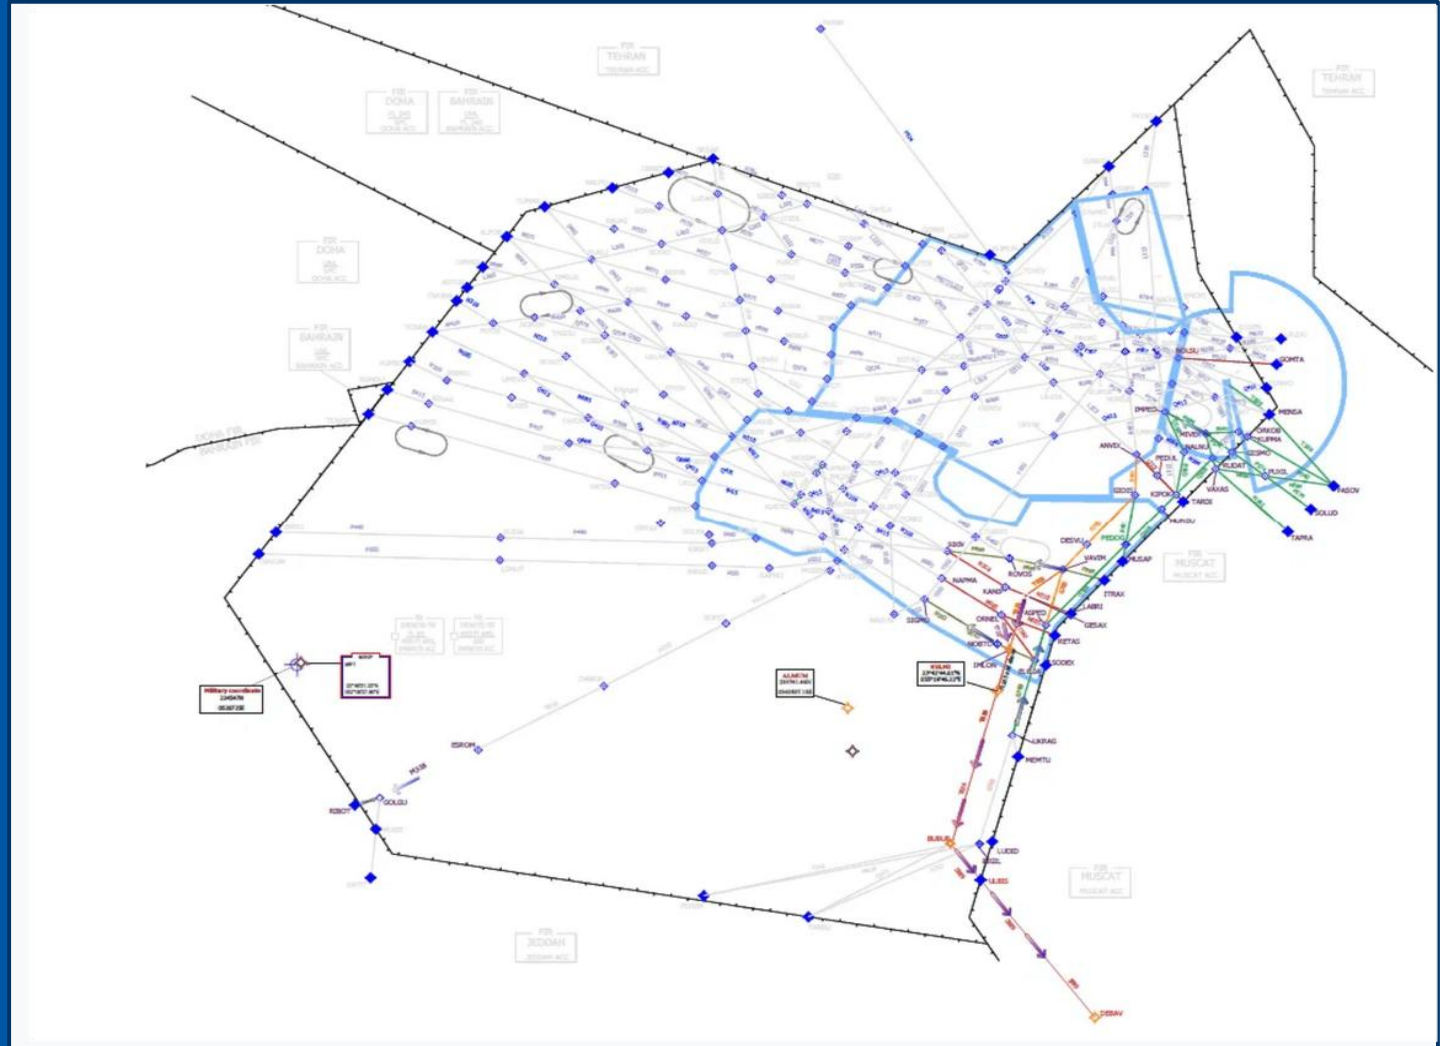

The Initial Corridor

Immediate Adaptation: The first response required shifting the majority of traffic to a narrow corridor in the East and South East of the FIR.

New Connectivity: Rapid design of new waypoints and routes to safely connect with the adjacent FIRs' network.

Learning from the Past: The threat profile differed significantly from June 2025, requiring entirely new designs rather than reusing old contingency routes.

Routes Evolution

Network Maturity

Expanding Capacity:

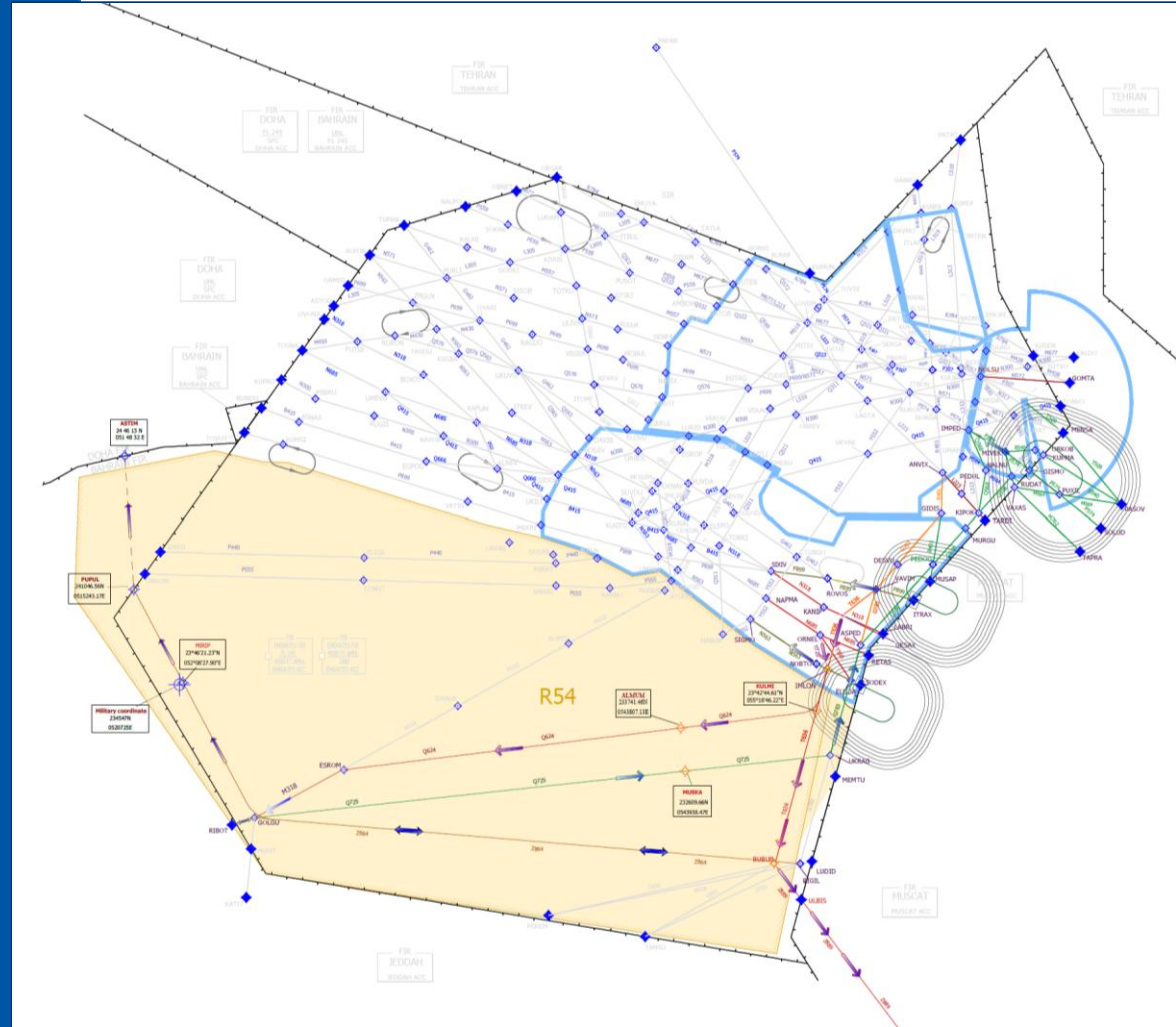

As the situation stabilized, the network grew to allow more routing options based on continuous threat assessments.

Regional Support:

Additional routes were created specifically to generate flying opportunities for other countries, such as Qatar.

Safe Holding:

Crucially, new contingency holds were designed to provide safe areas for aircraft to hold during sudden threats or temporary closures.

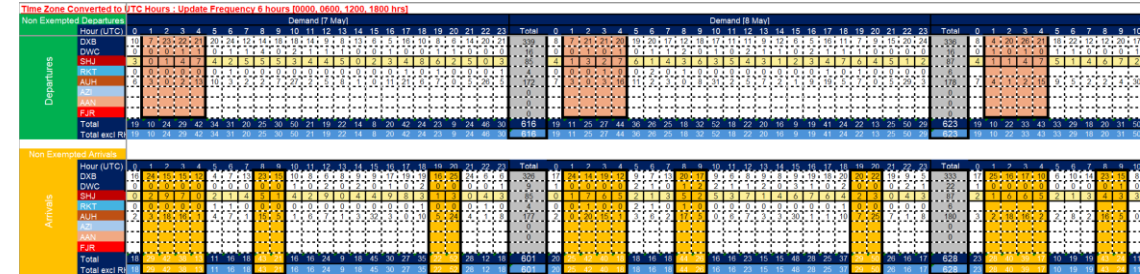

Traffic Daily Plan (TDP) Portal

National Platform: 24/7 live portal for AOCCs & ANSPs (UAE Slot Planning Group).

Transparency: 5-day horizon view for planning across airports & the Emirates FIR.

Granular Control: Hour divided into 15-minute intervals to manage congestion, control surge of traffic, and maintain airspace stability in peak periods

Supply Chain Protection: Maintain cargo flight continuity during quiet periods.

7-May

Hour (UTC)	Departure Demand							Total
	DXB	DWC	SHJ	RKT	AUH	AZI	AAN	
00:00	5	1	0	1	3			10
00:15	2	0	1	0				4
00:30	2	0	1	0	1			4
00:45	1	0	1	0	1			3
01:00	1	1	0	0				3
01:15	1	1	0	0	1			3
01:30	1	0	0	0	0			1
01:45	4	2	0	0	1			7
02:00	5	0	0	1	0			6
02:15	3	0	0	0	0			3
02:30	6	0	1	0	0			7
02:45	9	0	0	0	0			9
03:00	8	0	2	0	1			11
03:15	0	0	0	0	0			0

EMIRATES FIR EVENTS & COMPLIANCE REPORT

Period: 02 March - 05 May 2026 | Issued: 06 May 2026 |

1. MAJOR AIRPORTS CLOSURE & RECOVERY

The table below summarizes closure events and time-to-recovery for the three primary airports within the Emirates FIR. Time-to-recovery is measured from the first logged restriction to the continued back to normal entry for that airport.

Airport	Closure Events	Duration	Avg Time to Recovery (hrs)	Largest Closure (hrs)
DMBA	135	43:21	0:20	0:32 (16 Mar 26)
DMBA AI	103	25:24	0:16	2:16 (15 Mar 26)
DMBA	94	45:53	0:28	5:27 (23 Mar 26)
DMBA	93	23:49	0:15	1:07 (16 Mar 26)

2. AIRPORT COMPLIANCE - 05 MAY 2026

The table below shows actual versus planned movements per airport with colour-coded compliance indicators. In addition, a comparison chart to provide Monitoring actual vs Capacity by airport.

Indicator	Actual	Planned	Capacity
DMBA	100%	100%	100%
DMBA AI	100%	100%	100%
DMBA	100%	100%	100%

MIDANPIRG/23 & RASG-MID/13

Monitoring & Compliance: Monitoring tool to ensure adherence to slots, compliance with flow measures, and post-analysis efforts

Data-Driven Operations & Fast-Time Simulation

Capacity Ceiling/sector Identified: Fast-time simulations revealed a hard capacity constraints under the restricted airspace configuration.

Workload vs Occupancy: Controller workload exceeded what standard occupancy metrics indicated due to extreme traffic complexity (crossing flows, multi-airport interactions).

Hourly Demand Management: Detailed Demand vs Capacity Assessments were used to tackle traffic down to the hour, preventing sector overloads.

Safety Validation: New contingency routes were rigorously tested in simulators to ensure fly-ability and preserve ATCO wellness before live deployment.

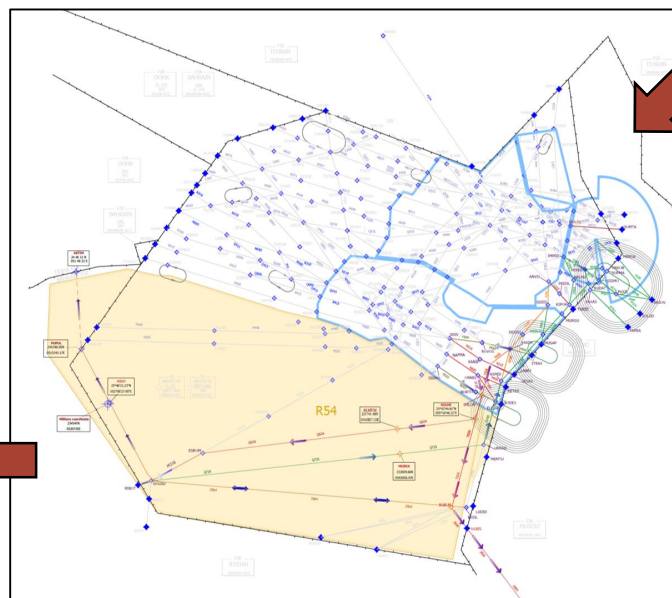

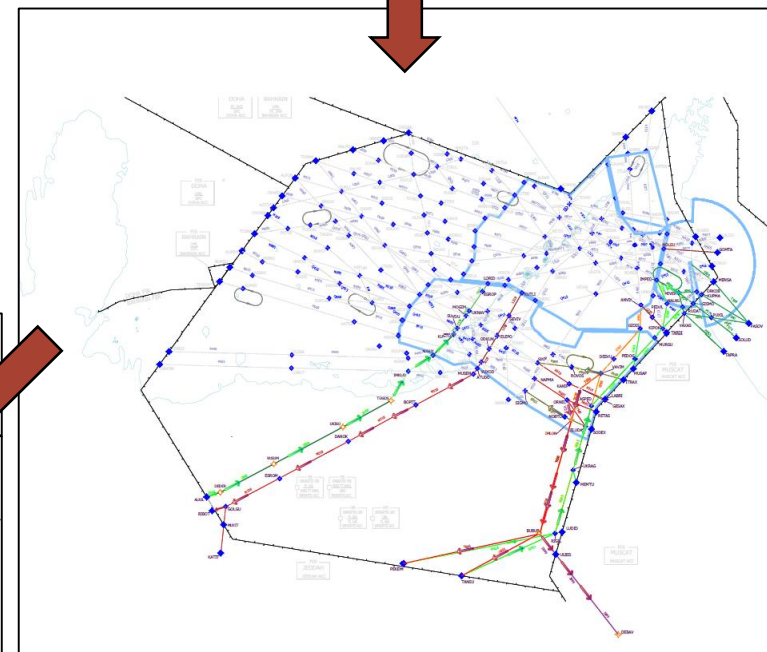

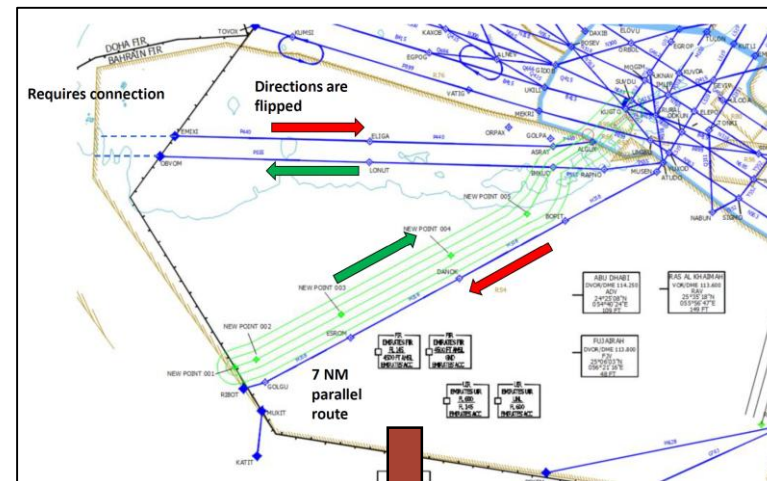

Strategic Re-designed Network & Sectors

Structural Intervention: Airspace configuration required immediate structural changes to handle demand safely.

Workforce Reallocation: Personnel from inactive western/northern sectors were shifted to support congested eastern sectors.

ATCO Wellness: Redesign primarily aimed to ensure safety and relieve stress from controllers managing unprecedented complexity.

Recovery Trajectory

Structured Growth

From a near-standstill in early March, traffic was methodically scaled up as confidence and capacity grew.

Return of Overflights:

A critical milestone was the safe reintroduction of overflying traffic, reconnecting the region globally.

Airport Resilience:

Traffic distribution ensured aviation continued across all airports, utilizing alternative airports when specific threats arose.

Key Principles

Dynamic Flow measures ✓

constant civil-military coordination ✓

Real-time assessments ✓

Stakeholder engagement ✓

March 2026

May 2026

Regional Coordination & Cooperation

“Initiatives to open routes over the Arabian Gulf went beyond-border to provide assistance to States not directly connected with us.”

- ✓ **MID Contingency Cell** Leveraged this platform to facilitate regional efforts, turning them into reality with unified NOTAMs and procedures.
- ✓ **GCC Contingency Cell** We took the lead in encouraging and coordinating the opening of new routes over the Arabian Gulf to bypass conflict zones.
- ✓ **Arabian Gulf Corridors** Proactively provided advice and strategic assistance to non-adjacent states struggling with the network disruptions.
- ✓ **Extended Assistance**

Lessons Learned

Key Lessons Learned

Stakeholders Collaboration : The need to have multiple levels of collaboration with the stakeholders in a systematic manner is vital

Civil-Military Synergy: Absolute trust and continuous communication with military partners is the single point of failure or success.

Data is King: Granular, 15-minute interval data and fast-time simulations prevented catastrophic sector overloads.

Permanent Civil-Military Cell: Establish a permanent, integrated airspace management cell rather than an ad-hoc contingency group.

Systematize the TDP: Upgrade the Traffic Daily Plan into a permanent, automated regional slot management tool.

Pre-Emptive Sector Design: Maintain pre-validated "crisis sectorization" plans ready for immediate deployment.

Strategic Recommendation

INSTITUTIONALIZE CIVIL-MILITARY CELLS

Transition the temporary joint coordination cells into permanent, 24/7 integrated civil-military airspace management units to ensure immediate readiness.

MODULAR AIRSPACE ARCHITECTURE

Develop and pre-validate dynamic sector configurations and contingency holds that can be rapidly deployed to handle sudden capacity shifts.

REGIONAL CONTINGENCY PLAYBOOK

Formalize the successful Arabian Gulf routing strategies and cross-border assistance models into a binding, standardized regional framework.

PREDICTIVE ATFM INTEGRATION

Upgrade the Traffic Daily Plan (TDP) portal into a permanent, predictive flow management tool linked directly with adjacent FIRs and stakeholders.

Ensure airspace contingency routes, procedures, and associated measures are pre-coordinated, published in the AIP, and maintained in a state of readiness for rapid deployment whenever operational conditions require

QUESTIONS & DISCUSSION

Special thanks to our ATCOs, Military Partners, Adjacent FIRs, and Airspace Users for their unwavering cooperation, professionalism, and resilience during the contingency operations.
