

**Carbon Offsetting and Reduction Scheme
for International Aviation (CORSA)**

— Frequently Asked Questions (FAQs) —

(updated as of 13 September 2019)

C  **RSIA**

Note:

The information included in the responses to the selected “Frequently Asked Questions” makes reference to the following documents:

- *Assembly Resolution A39-3: Consolidated statement of continuing ICAO policies and practices related to environmental protection – Global Market-based Measure (MBM) scheme¹, adopted by the 39th Session of the ICAO Assembly (27 September – 6 October 2016);*
- *First edition of Annex 16 — Environmental Protection, Volume IV – Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)², adopted by the ICAO Council at its 214th Session (11 - 29 June 2018);*
- *First edition of the Environmental Technical Manual (Doc 9501), Volume IV, — Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)³; and*
- *The five ICAO CORSIA Implementation Elements⁴ as reflected in 14 ICAO documents approved by the ICAO Council for publication. These ICAO documents are directly referenced in Annex 16, Volume IV and are essential for the implementation of the CORSIA.*

TABLE OF CONTENTS

1.	General questions about a market-based measure (MBM) and CORSIA
1.1	What is a market-based measure (MBM)?
1.2	What is the contribution of aviation to global greenhouse gas emissions?
1.3	Why does the Paris Agreement not include international aviation emissions?
1.4	Why did ICAO decide to develop a global MBM scheme for international aviation?
1.5	What ICAO process was followed to develop CORSIA?
1.6	What is CORSIA and how does it work, in general?
2.	Questions about CORSIA’s key design elements
	Key design element 1: Phased implementation of CORSIA
2.1	What is the rationale for the phased implementation of CORSIA?
2.2	What are the different phases?
2.3	What is the difference between the pilot phase (from 2021 through 2023) and the first phase (from 2024 through 2026)?
2.4	Which criteria determine the participation or exemption of States from CORSIA offsetting in its second phase from 2027 to 2035?
2.5	What is a “RTK”?
2.6	How are RTK shares calculated?
	Key design element 2: Route-based approach of CORSIA
2.7	What is the route-based approach of CORSIA?
2.8	What does “participation of States to CORSIA offsetting” mean for the route-based approach?
2.9	Can the characterization of a route as “covered” or “not covered” by the CORSIA offsetting change over time?
2.10	Do States and aeroplane operators that do not participate in the CORSIA offsetting have any requirements under the CORSIA?
2.11	Can an aeroplane operator have offsetting requirements, even if its State of registration does not participate in CORSIA offsetting?
2.12	What would happen to the CORSIA emissions coverage if an operator of a non-participating State flies on the routes between participating States (e.g. fifth-freedom traffic right)?
2.13	What would happen to the emissions coverage by the CORSIA if a State without an operator decides to participate in the CORSIA offsetting?
	Key design element 3: CORSIA offsetting requirements and eligible emissions units
2.14	What is offsetting and how does it work, in general?
2.15	How are an aeroplane operator’s offsetting requirements calculated?
2.16	What are CORSIA’s compliance periods?

2.17	What are CORSIA’s baseline emissions?
2.18	What is the difference between the Sector’s Growth Factor used by the formula under the CORSIA and the generally-used term “emissions growth rate”?
2.19	How are CORSIA Eligible Fuels accounted for in the calculation of offsetting requirements?
2.20	Can an aeroplane operator’s CO₂ offsetting requirements be negative?
2.21	Will an aeroplane operator, which reduces its emissions compared to the baseline, have any offsetting requirements?
	Key design element 4: Exemptions and new entrants
2.22	Does the CORSIA include provisions to exempt very low international aviation activities?
2.23	How will the CORSIA apply to new operators that will initiate activities after the entry into force of the scheme (a so-called “new entrant”)?
2.24	Will a new entrant operator affect the CORSIA baseline?
2.25	If an aeroplane operator, which (in the past) had domestic operations only, establishes international routes, will it be considered a new entrant?
	Key design element 5: Review process
2.26	Does the CORSIA include provisions to review its implementation and to make adjustments if needed?
2.27	What are the methodologies and procedures for periodic reviews of CORSIA?
3.	Questions about Annex 16, Volume IV - CORSIA
	General questions related to Annex 16, Volume IV
3.1	What are the differences between: Annex 16, Volume IV; Environment Technical Manual, Volume IV; and CORSIA Implementation Elements?
3.2	What ICAO process was followed to develop Annex 16, Volume IV?
	Administrative aspects
3.3	What is the definition of international flight for CORSIA purposes?
3.4	What guidance should be followed to determine whether a flight is international or domestic?
3.5	Does CORSIA apply to international flights to/from non-ICAO States?
3.6	What is the definition of an "aeroplane" in CORSIA? How does this definition differ from the definition of an “aircraft”?
3.7	What is the definition of “an aerodrome” in CORSIA?
3.8	How are diverted flights handled in CORSIA?
3.9	What does a “State pair” mean? Is it uni- or bidirectional?
3.10	Who will ensure that aeroplane operators comply with the requirements of Annex 16, Volume IV?
3.11	How is an international flight being attributed to a single aeroplane operator?
3.12	How is an aeroplane operator being attributed to a single State?

3.13	Can an aeroplane operator delegate its administrative requirements?
3.14	Can an aeroplane operator report together with one or more of its subsidiaries?
3.15	Who is responsible for reporting emissions from flights operated with leased aeroplanes?
3.16	Can a State delegate its administration processes under the CORSIA to another State?
3.17	How long does a State and an aeroplane operator need to keep CORSIA-related records? What is included in those records?
	Monitoring, reporting and verification (MRV) in general
3.18	What are the components of the CORSIA MRV system?
3.19	What is the applicability of the CORSIA MRV requirements? Are there any exemptions?
3.20	Can an aeroplane operator with emissions of less than 10 000 tonnes of CO₂ per year be included in CORSIA?
3.21	What are the actions for an aeroplane operator, who has been covered by CORSIA, but now drops below the 10 000 tonnes of CO₂ threshold?
3.22	How to address aeroplane operators with annual CO₂ emissions close to the 10 000 tonnes threshold?
3.23	Are aeroplane manufacturers or airports subject to any requirements under Annex 16, Volume IV?
3.24	Is a re-positioning flight before or after an exempted humanitarian, medical or firefighting flight exempt?
3.25	Are helicopter operations covered by the CORSIA MRV system?
3.26	Are international flights by police, military, customs or State aircraft within the scope of applicability of the CORSIA MRV system?
3.27	How can humanitarian, medical, firefighting, police, military, customs and State aircraft flights be identified?
3.28	Are Search and Rescue (SAR) flights exempted from CORSIA?
3.29	How are diversions handled in CORSIA?
	Emissions Monitoring Plan
3.30	What is an Emissions Monitoring Plan and why is it needed?
3.31	What are the contents of an Emissions Monitoring Plan?
3.32	Is there a standardized template for an Emissions Monitoring Plan?
3.33	When should an aeroplane operator submit an Emissions Monitoring Plan to the State?
3.34	When will the Emissions Monitoring Plan be approved by the State?
3.35	Does the third-party verification body need to review the Emission Monitoring Plan prior to its review and approval by the State?
3.36	What happens if an aeroplane operator does not have an approved Emissions Monitoring Plan on 1 January 2019?
3.37	Does the Emissions Monitoring Plan have to be submitted annually?

3.38	What happens if there are changes to the information contained in an Emissions Monitoring Plan?
3.39	How should non-material changes to an Emissions Monitoring Plan be communicated to the State?
	Monitoring
3.40	How does an aeroplane operator monitor its fuel use and CO₂ emissions?
3.41	Who approves the monitoring method for an aeroplane operator?
3.42	Who are eligible to use the ICAO CORSIA CO₂ Estimation and Reporting Tool (CERT)?
3.43	Where can one access the ICAO CORSIA CERT?
3.44	Where can one find more information about ICAO CORSIA CERT?
3.45	What are the five Eligible Fuel Use Monitoring Methods? Are they different from ICAO CORSIA CERT?
3.46	Is it necessary to describe all five Fuel Use Monitoring Methods in the Emissions Monitoring Plan, even if not all are used?
3.47	Is it possible to use a Fuel Use Monitoring Method for reporting that is different to the method(s) described in the approved Emissions Monitoring Plan?
3.48	Can an aeroplane operator change its Fuel Use Monitoring Method?
3.49	Can an aeroplane operator use several different Fuel Use Monitoring Methods?
3.50	How is “Block-off” and “Block-on” defined in Fuel Use Monitoring Method “Block-off / Block-on”?
3.51	What are the data requirements for the Fuel Use Monitoring Method “Fuel Allocation with Block Hour”?
3.52	How should missing data under the Fuel Use Monitoring Method “Fuel Allocation with Block Hour” be handled?
3.53	What will happen if an aeroplane operator exceeds the eligibility threshold to use ICAO CORSIA CERT during a given year?
3.54	How is fuel use treated while performing non-commercial activities (e.g., APU fuel use during maintenance)?
3.55	How are CO₂ emissions calculated from the fuel used?
3.56	Why do we need to know total CO₂ emissions from international aviation?
3.57	What are the requirements for fuel density?
3.58	What is the standard fuel density?
3.59	How to account for the use of CORSIA Eligible Fuels in the CORSIA MRV system?
	Reporting
3.60	What is the timeline for reporting of CO₂ emissions, and who will report to whom?
3.61	Do all international routes have to be included in the Emissions Report, or only the international routes between participating States in the CORSIA offsetting?
3.62	Who decides on the selection of aggregation level for the CO₂ emissions data (State

	<u>pair or aerodrome pair)?</u>
3.63	<u>What is the level of aggregation of the CO₂ emissions information that will be reported to States, and to ICAO?</u>
3.64	<u>What is the ICAO tool to facilitate reporting of the necessary information from States to ICAO?</u>
3.65	<u>Where can one find more information about the CORSIA Central Registry CCR?</u>
3.66	<u>Are there any provisions regarding the confidentiality of data if a route is only operated by one operator?</u>
3.67	<u>Are the reporting periods and compliance periods the same for all operators?</u>
3.68	<u>Is there an established template for reporting annual CO₂ emissions from an aeroplane operator to the State, and from the State to ICAO?</u>
3.69	<u>What if there are gaps identified in the reported data?</u>
3.70	<u>What constitutes a data gap? How can such data gaps be addressed?</u>
3.71	<u>What constitutes a data gap?</u>
3.72	<u>Is the 5 per cent data gap threshold based on CO₂ emissions or number of flights?</u>
3.73	<u>Is an alternative estimation approach (instead of using the ICAO CORSIA CERT) possible for addressing data gaps?</u>
3.74	<u>Will CORSIA's baseline emissions be affected due to an error correction to the Emissions Report?</u>
3.75	<u>What happens in case of late reporting or no reporting at all by an aeroplane operator or a State?</u>
3.76	<u>Who reports emissions from an aeroplane operator that has gone bankrupt during a reporting year?</u>
3.77	<u>Why does a State need to provide State pair data to ICAO, even if this data has been identified as confidential?</u>
3.78	<u>How does an aeroplane operator report the use of CORSIA Eligible Fuels?</u>
3.79	<u>Why should an aeroplane operator report CORSIA Eligible Fuels every year while the compliance cycle is three years?</u>
3.80	<u>What will be the process of reporting of emissions unit cancellations?</u>
	Verification
3.81	<u>How does the verification of CO₂ emissions work in CORSIA? Who will do the verification?</u>
3.82	<u>Is it necessary for an aeroplane operator to perform an internal pre-verification of its Emissions Report, prior to the third-party verification?</u>
3.83	<u>Does the voluntary pre-verification by an aeroplane operator substitute the third-party verification?</u>
3.84	<u>Is a third-party verification needed when an aeroplane operator uses the ICAO CORSIA CERT?</u>
3.85	<u>What are the requirements to be accredited as a verification body to conduct the third-party verification?</u>

3.86	Are the references to ISO standards included in Annex 16, Volume IV to specific versions, or will the latest version of ISO standard be automatically referred to?
3.87	What are the requirements for the verification of an Emissions Unit Cancellation Report?
3.88	How much time is normally required for the third-party verification?
3.89	Who pays for the third-party verification and what will be the price? Is a price list included in the list of verification bodies to be compiled by ICAO?
3.90	Who accredits the verification body?
3.91	Can an aeroplane operator become a verification body?
3.92	How can an aeroplane operator identify an accredited verification body?
3.93	Does the verification body have to be from the administrating State of an aeroplane operator?
3.94	What if there is no accredited verification body in a State?
3.95	What can a State do if it has limited accreditation structure in place to support the verification process?
3.96	Must a State ensure to have accredited verification bodies through its national accreditation body by 30 April 2019?
3.97	What may a witness audit involve during the accreditation process of a verification body?
3.98	How does a verification team meet the knowledge requirements?
3.99	How does a verification team meet the technical expertise requirements?
3.100	How does an independent reviewer meet the knowledge and technical expertise requirements?
3.101	Can the independent review be outsourced to another verification body?
3.102	To avoid conflicts of interest, the leader of the verification team cannot undertake more than six verifications without a three consecutive year break. What if the leader performs three verifications, stops for one year, and then performs another three verifications?
3.103	What are the contents of a Verification Report?
3.104	Is there a template for Verification Report?
3.105	What does “materiality” mean in connection to the verification of CO₂ emissions?
3.106	Does the verification body need to include non-material misstatements and non-conformities as a part of the Verification Report?
3.107	Is a non-conformity acceptable if it does not lead to a material discrepancy?
3.108	What are the available sources of information for a State when conducting the order of magnitude check?
3.109	Why do both the aeroplane operator and verification body submit Emission Report and Verification Report to the State?
3.110	Does ICAO provide training on CORSIA verification requirements?
4.	Questions about CORSIA Implementation Elements

	CORSIA States for Chapter 3 State Pairs
4.1	What are “Chapter 3 State Pairs”?
4.2	When will the first edition of ICAO document “CORSIA States for Chapter 3 State Pairs” become available?
4.3	Where can the ICAO document “CORSIA States for Chapter 3 State Pairs” be found?
	ICAO CORSIA CO₂ Estimation and Reporting Tool (CERT)
4.4	What is ICAO CORSIA CERT?
4.5	What are the different versions of the ICAO CORSIA CERT?
4.6	What is new in the 2019 version of the ICAO CORSIA CERT?
4.7	Can an Emissions Report that was generated by the ICAO CORSIA CERT be submitted from an aeroplane operator to the State?
4.8	Can the ICAO CORSIA CERT be used for an aeroplane operator’s internal pre-verification?
4.9	Will the third-party verification of an Emissions Report be cheaper when an aeroplane operator has used the ICAO CORSIA CERT for monitoring?
4.10	Where can one find more information about the ICAO CORSIA CERT?
	CORSIA Eligible Fuels
4.11	What is the definition of “CORSIA Eligible Fuels“?
4.12	Which sustainability criteria shall be met by CORSIA Eligible Fuels?
4.13	Which life cycle emissions values will be used for calculating the emissions reductions from CORSIA Eligible Fuels?
4.14	What constitutes the life cycle emission value of a CORSIA Eligible Fuel?
4.15	Who certifies CORSIA Eligible Fuel in order to be used in CORSIA?
4.16	What are the requirements for Sustainability Certification Schemes?
4.17	Where can one find a list of approved Sustainability Certification Schemes?
4.18	Can an aeroplane operator claim all the CORSIA Eligible Fuel it has purchased?
4.19	Which date is relevant in order to claim a batch of CORSIA Eligible Fuel?
	CORSIA Eligible Emissions Units
4.20	What are emissions units, in general?
4.21	What are the eligible emissions units to be used under CORSIA?
4.22	What are the eligibility criteria for CORSIA Eligible Emissions Units?
4.23	Can an aeroplane operator already start purchasing CORSIA Eligible Emissions Units?
4.24	Can an aeroplane operator implement a project that generates CORSIA Eligible Emissions Units?
4.25	Can an aeroplane operator cancel CORSIA eligible emissions units prior to having received the total final offsetting requirements from the State at the end of a compliance cycle?
4.26	What happens if an operator does not cancel enough CORSIA Eligible Emissions

	Units to meet its offsetting requirements?
4.27	What is the “Technical Advisory Body” (TAB)?
4.28	What are the tasks of the TAB? Who are the TAB members?
4.29	What is the timeline for the work of the TAB?
4.30	How will the TAB adjust to changing contexts, such as decisions at the UNFCCC?
4.31	Where can one find more information about the TAB?
	CORSIA Central Registry (CCR)
4.32	What is the CORSIA Central Registry (CCR)?
4.33	When will the CCR become available?
4.34	How does the reporting from a State to ICAO work before the CCR becomes operational (e.g., submission of list of aeroplane operators attributed to a State)?
4.35	If an aeroplane operator is in a parent-subsidiary relationship, does the State need to list the subsidiary operator on the CCR?
4.36	Should the list of aeroplane operators include operators which do not have any requirements under CORSIA?
4.37	How can a State validate information contained in the list of verification bodies accredited in the State?
4.38	What is the information that a State submits to ICAO in relation to accredited verification bodies?
4.39	Will the lists of aeroplane operators and accredited verification bodies be updated on a regular basis?
4.40	What levels of information will be available to the public from the CCR?
4.41	What happens to the data flagged as confidential by the State when CCR receives it?
4.42	How will the reporting of emissions units cancellations from State to CCR work?
5.	Questions about the cost impact of CORSIA
5.1	What is the estimated quantity to be offset under the CORSIA?
5.2	What is the estimated compliance cost for the CORSIA offsetting requirements by aeroplane operators?
5.3	What is the estimated administrative cost for the CORSIA implementation by States, aeroplane operators and ICAO?
6.	Questions about capacity building and assistance for CORSIA implementation
6.1	What is ICAO “ACT-CORSIA”?
6.2	What are the activities covered under the ICAO ACT-CORSIA?
6.3	What are CORSIA Buddy Partnerships?
6.4	How many ICAO Buddy Partnerships have been established under the ICAO ACT-CORSIA programme?
6.5	What is ICAO’s plan for continued capacity building for CORSIA implementation?
6.6	How can my State contribute to ICAO ACT-CORSIA?

6.7

What is ICAO doing to ensure the availability of verification bodies at the time when aeroplane operators will be required to have their Emissions Reports verified?

Carbon Offsetting and Reduction Scheme for International Aviation (CORSA)

Frequently Asked Questions (FAQs)

1.	General questions about a market-based measure (MBM) and CORSIA
1.1	What is a market-based measure (MBM)?
	A market-based measure (MBM) is a policy tool that is designed to achieve environmental goals at a lower cost and in a more flexible manner than traditional regulatory measures. Examples of MBMs include levies, emissions trading systems, and carbon offsetting.
1.2	What is the contribution of aviation to global greenhouse gas emissions?
	According to the Intergovernmental Panel on Climate Change IPCC (AR4 Climate Change 2007: Mitigation of Climate Change , pp 49; also see the IPCC Special Report on Aviation and the Global Atmosphere , pp 6), aviation (domestic and international) accounts for approximately 2 per cent of global CO ₂ emissions produced by human activity. International aviation is responsible for approximately 1.3 per cent of global CO ₂ emissions.
1.3	Why does the Paris Agreement not include international aviation emissions?
	<p>The Paris Agreement under the United Nations Framework Convention on Climate Change (UNFCCC) is an international treaty that was agreed in December 2015 and entered into force in November 2016 to enhance the implementation of the UNFCCC. Its aim is “to strengthen the global response to the threat of climate change” by establishing specific goals for “holding the increase in the global average temperature to well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C”.</p> <p>The Paris Agreement, adopted under the UNFCCC, addresses sectors and related greenhouse gas emissions following an approach similar to that of its overarching Convention. While all domestic GHG emissions are dealt with under the UNFCCC, GHG emissions associated with international aviation and maritime transport are to be dealt with under ICAO and International Maritime Organization (IMO), respectively. This approach is consistent with similar UNFCCC decisions that also apply to the Kyoto Protocol.</p> <p>In this regard, GHG emissions from domestic aviation, as per other domestic sources, are calculated as part of the UNFCCC national GHG inventories and are included in national totals (part of the Nationally Determined Contributions (NDCs) of the Paris Agreement), while GHG emissions from international aviation are reported separately and are not included in NDCs.</p> <p>ICAO, as a specialized UN agency to address all matters related to international civil aviation, including environmental protection, has been diligently addressing GHG emissions from international aviation. The ICAO agreement on carbon neutral growth and CORSIA complements the ambition of the Paris Agreement and constitutes the most significant international climate-related agreement since its adoption.</p>
1.4	Why did ICAO decide to develop a global MBM scheme for international aviation?
	<p>The ICAO Assembly has resolved that ICAO and its Member States, with relevant organizations, would work together to strive to achieve a collective medium term global aspirational goal of keeping the global net CO₂ emissions from international aviation from 2020 at the same level (so-called “carbon neutral growth from 2020”).</p> <p>The Assembly also defined a basket of measures designed to help achieve the ICAO’s</p>

global aspirational goal. This basket includes aircraft technologies such as lighter airframes, higher engine performance and new certification standards, operational improvements (e.g., improved ground operations and air traffic management), sustainable aviation fuels, and market-based measures (MBMs).

Based on the environmental trend assessment by the ICAO Council’s Committee on Aviation Environmental Protection (CAEP), international aviation fuel consumption is estimated to grow somewhere between 2.2 to 3.1 times by 2045 compared to the 2015 levels (for further details on the CAEP assessment, please refer to [Assembly Working Paper A40-WP/54](#) presented to the 40th Session of the ICAO Assembly).

The aggregate environmental benefits achieved by non-MBMs measures will not be sufficient for the international aviation sector to reach its aspirational goal. According to the CAEP analysis, international aviation emissions are forecasted to grow in the coming decades, as the projected annual improvements in aircraft fuel efficiency of around 1 to 2 per cent (as result of technological and operational measures), and the reductions from the use of sustainable aviation fuels in the short- to medium-term are expected to be largely surpassed by the forecasted traffic growth of around 5 per cent per year.

A global MBM scheme can help fill the emissions reductions gap, while further advancements in key technologies (e.g., engines, fuels) may result in further CO₂ emissions reductions in the future. The global MBM scheme is the preferred approach compared to having a patchwork of regional and local measures.

The Figure below illustrates the contribution of different measures for reducing international aviation CO₂ emissions.

1.5	What ICAO process was followed to develop CORSIA?
	Discussions on the application of MBMs as a means to limit or reduce CO ₂ emissions from international civil aviation had taken place prior to the 37th Session of the Assembly in 2010, which adopted Assembly Resolution A37-19: <i>Consolidated statement of continuing ICAO policies and practices related to environmental protection — Climate change</i> . Assembly Resolution A37-19 requested the Council, with the support of Member States and international organizations, to continue to explore the feasibility of a global MBM scheme by undertaking further studies on the

technical aspects, environmental benefits, economic impacts and the modalities of such a scheme, taking into account the outcome of the negotiations under the United Nations Framework Convention on Climate Change (UNFCCC) and other international developments, as appropriate, and report the progress for consideration by the 38th Session of the ICAO Assembly in 2013.

The 37th Session of the Assembly also adopted global aspirational goals for the international aviation sector of annual average fuel efficiency improvement of 2 per cent, and keeping the global net carbon emissions from 2020 at the same level (also referred to as carbon neutral growth from 2020).

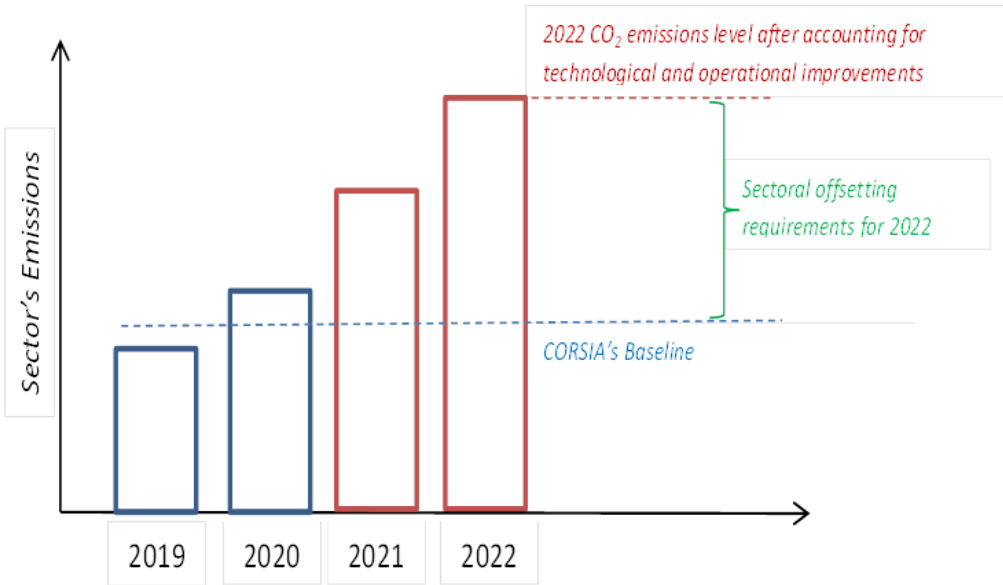

The work requested by Resolution A37-19 focused on the qualitative and quantitative assessments of potential options for a global MBM scheme for international aviation. Building on this work, the 38th Session of the ICAO Assembly in 2013, through Resolution A38-18: *Consolidated statement of continuing ICAO policies and practices related to environmental protection — Climate change*, decided to develop a global MBM scheme for international aviation, and requested the Council, with the support of Member States, to finalize the work on the technical aspects, environmental and economic impacts and modalities of the possible options for a global MBM scheme, including on its feasibility and practicability, taking into account the need for development of international aviation, the proposal of the aviation industry and other international developments, as appropriate, and without prejudice to the negotiations under the UNFCCC.

Assembly Resolution A38-18 further requested the Council to identify the major issues and problems, including those for Member States, and make a recommendation on a global MBM scheme that appropriately addresses them and key design elements, including a means to take into account special circumstances and respective capabilities of ICAO Member States. The Council was also requested to identify the mechanisms for the implementation of the scheme from 2020 as part of a basket of measures that also include technologies, operational improvements and sustainable aviation fuels to achieve ICAO's global aspirational goals.

Following the 38th Session of the Assembly, the 200th Session of the Council in November 2013 supported that the Committee on Aviation Environmental Protection (CAEP) would continue to undertake technical tasks related to the development of a global MBM scheme, as requested by Resolution A38-18. The Council also decided upon the establishment of an Environment Advisory Group of the Council (EAG), which was mandated to oversee all the work related to the development of a global MBM scheme and make recommendations to the Council.

The EAG focused its work on a mandatory carbon offsetting approach as the basis for a global MBM scheme for international aviation. The EAG/15 meeting in January 2016 considered a draft Assembly Resolution text on a global MBM scheme, which was further refined throughout 2016 by two meetings of a High-level Group on a Global MBM Scheme in February and April 2016, a High-level Meeting on a Global MBM Scheme in May 2016 and a Friends of the President Informal Meeting in August 2016.

The Assembly, by adopting [Resolution A39-3](#), agreed to implement a global MBM scheme in the form of CORSIA. It also requested the Council, with the technical contribution of CAEP, to develop the SARPs and related guidance material for the

	<p>implementation of the Monitoring, Reporting and Verification (MRV) system under the CORSIA.</p> <p>The CAEP developed SARPs for the CORSIA and, after amendment following the consultation with the Member States, Annex 16, Volume IV was adopted by the Council at its 214th Session (11 – 29 June 2018), and is applicable from 1 January 2019.</p>
1.6	<p>What is CORSIA and how does it work, in general?</p>
	<p>The CORSIA has been adopted as complementary to the broader package of measures to help ICAO achieve its aspirational goal of carbon-neutral growth from 2020 onwards. CORSIA relies on the use of emissions units from the carbon market to offset the amount of CO₂ emissions that cannot be reduced through the use of technological and operational improvements, and sustainable aviation fuels.</p> <p>The approach for CORSIA is based on comparing the total CO₂ emissions for a year (from 2021 onwards) against a baseline level of CO₂ emissions, which is defined as the average of CO₂ emissions from international aviation covered by the CORSIA for the years 2019 and 2020 (see question 2.17 for more details on CORSIA’s baseline). In the following years, any international aviation CO₂ emissions covered by the CORSIA that exceed the baseline level represent the sector’s offsetting requirements for that year (see graph below for an illustrative example for year 2022).</p>  <p>The sectoral offsetting requirements are shared among aeroplane operators participating in the CORSIA based on the sectoral growth factor and the individual CO₂ emissions of the operators. For more details on calculating offsetting requirements, please see question 2.15.</p> <p>The CORSIA will be implemented in three phases, starting with participation of States in the CORSIA offsetting on a voluntary basis (pilot phase and first phase), followed by participation of all States except the States exempted from offsetting requirements, as follows:</p> <ul style="list-style-type: none"> • Pilot phase: from 2021 to 2023; • First phase: from 2024 to 2026; and • Second phase: from 2027 to 2035.

	<p>See questions 2.1 – 2.6 for more information regarding the phased implementation of CORSIA, as well as on how to determine States’ participation in different phases.</p> <p>It is important to note that all States whose aeroplane operator undertakes international flights need to develop a monitoring, reporting and verification (MRV) system for CO₂ emissions from international flights starting from 1 January 2019. The requirement to monitor, report and verify CO₂ emissions from international aviation is independent from the offsetting requirements, and the data reported by States will be used for the calculation of the CORSIA’s baseline, as well as for the basis of calculating aeroplane operators offsetting requirements, where applicable. See section 3 of these FAQs for more information on CORSIA MRV system.</p>
2.	Questions about CORSIA’s key design elements
	Key design element 1: Phased implementation of CORSIA
2.1	<p>What is the rationale for the phased implementation of CORSIA?</p> <p>Paragraph 9 of the Assembly Resolution A39-3 determines the phased implementation of the CORSIA, and the participation of States in the CORSIA offsetting. According to this paragraph, phased implementation of CORSIA intends to accommodate “the special circumstances and respective capabilities of States, in particular developing States, while minimizing market distortion.”</p>
2.2	<p>What are the different phases?</p> <p>The CORSIA has three phases: a pilot phase (2021 – 2023); a first phase (2024 – 2026); and a second phase (2027 – 2035).</p> <p>The difference between the phases is that the participation of States in the CORSIA offsetting in the pilot phase and first phase is voluntary, whereas the second phase applies to all ICAO Member States (See also questions 2.3 and 2.4 for details).</p> <p>States that voluntarily decide to participate in CORSIA offsetting may join the scheme from the beginning of a given year, and should notify ICAO of their decision to join by June 30 of the preceding year.</p> <p>The figure below illustrates the different phases of CORSIA.</p>  <ul style="list-style-type: none"> • Participation of States in the pilot phase (2021 to 2023) and first phase (2024 to 2026) is voluntary. • For the second phase from 2027, all States with an individual share of international aviation activity in year 2018 above 0.5% of total activity or whose cumulative share reaches 90% of total activity, are included. Least Developed Countries, Small Island Developing States and Landlocked Developing Countries are exempt unless they volunteer to participate.
2.3	What is the difference between the pilot phase (from 2021 through 2023) and the first

	<p>phase (from 2024 through 2026)?</p> <p>The requirements for the two phases are identical except for how the aeroplane operator’s offsetting requirements are determined by the State. Specifically:</p> <ul style="list-style-type: none"> • For the pilot phase, States have two options to determine the basis of an aeroplane operator’s offsetting requirements: <ul style="list-style-type: none"> ○ Option 1: Use the aeroplane operator’s emissions covered by CORSIA in a given year (i.e. 2021, 2022 and 2023) ○ Option 2: Use the aeroplane operator’s emissions for the year 2020. • For the first phase, the calculation to determine an aeroplane operator’s offsetting requirements is based on the emissions in a given year (i.e. 2024, 2025 and 2026). <p>For more details on calculating offsetting requirements, please see question 2.15.</p>
2.4	<p>Which criteria determine the participation or exemption of States from CORSIA offsetting in its second phase from 2027 to 2035?</p> <p>Unlike the voluntary participation of States in the CORSIA offsetting in the pilot and first phases from 2021 to 2026, the second phase of the CORSIA from 2027 to 2035 applies to all Member States. There are, however, two categories of exemptions based on aviation-related and socio-economic criteria. These criteria for the exemption of States from the CORSIA offsetting requirements in the second phase are defined in A39-3 paragraph 9 e).</p> <p>For aviation-related criteria, there are two thresholds:</p> <ul style="list-style-type: none"> • States whose individual share of international aviation activities in Revenue Tonne Kilometers (RTKs) in year 2018 is below 0.5 per cent of total RTKs; and • States that are not part of the list of States that account for 90 per cent of total RTKs when sorted from the highest to the lowest amount of individual RTKs. <p>For socio-economic criteria, States that are defined as Least Developed Countries (LDCs); Small Island Developing States (SIDS); and Landlocked Developing Countries (LLDCs), regardless of their level of international aviation RTK share, are exempted from offsetting requirements in the second phase of CORSIA. Nevertheless, these States can voluntarily participate in the second phase of the CORSIA.</p>
2.5	<p>What is a “RTK”?</p> <p>Revenue Tonne Kilometers or RTKs is the utilized (or sold) capacity for passengers and cargo expressed in metric tonnes, multiplied by the distance flown. In other words the RTK levels correspond to the volume of air transport activity. As an aeroplane operator carries more passengers and cargo over a longer distance, the RTK levels of the operator increase.</p> <p>A State’s RTK represent the total RTK levels of all aeroplane operators registered to that State. Annual RTK data is being reported from Member States to ICAO as part of the ICAO Statistics Programme, and published in the Annual Report of the ICAO Council.</p> <p>RTK data for the year 2018 will be used for the purposes of determining the participation of States in the second phase of the CORSIA (see question 2.4).</p>
2.6	<p>How are RTK shares calculated?</p> <p>A State’s individual RTK share is calculated by dividing the State’s RTKs by the total RTKs of all States.</p> <p>The cumulative RTK share is calculated by sorting the individual RTK shares from the highest to lowest, then successively increasing the value by summing the RTK</p>

	shares from highest to lowest until the value reaches 90%. The values of all States are considered for this calculation, regardless of whether a State is exempted or not from offsetting requirements under the CORSIA.
	Key design element 2: Route-based approach
2.7	What is the route-based approach of CORSIA?
	<p>Paragraph 10 of the Assembly Resolution A39-3 defines the coverage of the CORSIA offsetting on the basis of routes between States, with a view to minimizing market distortions between aeroplane operators on the same routes. For this purpose, the approach is to provide equal treatment of all aeroplane operators on a given route. Specifically:</p> <ul style="list-style-type: none"> • A route is covered by the CORSIA offsetting if both States connecting the route participate in the scheme. • A route is not covered by the CORSIA offsetting if one or both States connecting the route do not participate in the scheme. <p>When an aeroplane operator calculates its CO₂ emissions covered by the CORSIA offsetting in a given year, it needs to take into consideration emissions from its operations on all the routes covered by the scheme, as outlined in paragraph 10 of the Assembly Resolution.</p> <p>It should be noted that the applicability of CORSIA offsetting requirements and the applicability of CORSIA monitoring, reporting and verification (MRV) requirements are not the same. Even if an international flight is not covered by the offsetting requirements, it is still covered by the MRV requirements. See question 3.19 for more information on the applicability of CORSIA MRV requirements.</p> <p>The figure below illustrates CORSIA’s route-based approach, and the applicability of MRV and offsetting requirements.</p>

CORSIA ROUTE-BASED APPROACH

2.8	<p>What does “participation of States to CORSIA offsetting” mean for the route-based approach?</p>
	<p>The term “participation of States to CORSIA offsetting” means that if a State participates in CORSIA offsetting, then all routes between this State and all other States participating in CORSIA offsetting are covered by offsetting requirements.</p> <p>Please see questions 2.2 and 2.4 for details on how the participation to CORSIA offsetting is being determined in different phases.</p>
2.9	<p>Can the characterization of a route as “covered” or “not covered” by the CORSIA offsetting change over time?</p>
	<p>Paragraph 10 of the Assembly Resolution A39-3 determines the characterization of a route as “covered” or “not covered” by the CORSIA offsetting requirements, on the basis of whether the States connecting the route participate in CORSIA offsetting.</p> <p>The voluntary participation of States in different phases of the CORSIA will determine the overall coverage of the scheme.</p> <p>To give certainty on the routes to be covered by the CORSIA offsetting requirements every year, the Assembly Resolution A39-3 sets a deadline by 30 June of the preceding year for States to notify ICAO of their intention to voluntarily participate in the scheme, or discontinue their participation, from 1 January of the following year.</p>
2.10	<p>Do States and aeroplane operators that do not participate in the CORSIA offsetting have any requirements under the CORSIA?</p>
	<p>According to paragraph 20 of the Assembly Resolution A39-3, all States whose aeroplane operator undertakes international flights need to develop a monitoring, reporting and verification (MRV) system for CO₂ emissions from international flights</p>

	<p>starting from 1 January 2019. The requirement to monitor, report and verify CO₂ emissions from international aviation is independent from the offsetting requirement.</p> <p>The data reported by States will be used for the calculation of the CORSIA baseline, which is the average of 2019 and 2020 CO₂ emissions, as well as for the calculation of the aeroplane operators' offsetting requirements, where applicable.</p>
2.11	<p>Can an aeroplane operator have offsetting requirements, even if its State of registration does not participate in CORSIA offsetting?</p>
	<p>Yes. Because of the CORSIA's route-based approach, an operator operating on routes between participating States would be subject to the offsetting requirements under the CORSIA, no matter whether its State of registration participates in CORSIA offsetting or not.</p>
2.12	<p>What would happen to the CORSIA emissions coverage if an operator of a non-participating State flies on the routes between participating States (e.g. fifth-freedom traffic right)?</p>
	<p>Because of the CORSIA's route-based approach, these routes between participating States would be subject to the coverage of emissions offsetting requirements under the CORSIA. Thus, an operator of a non-participating State would be subject to offsetting requirements if it had a flight between two participating States, and emissions from such flights would be added to the coverage of CORSIA's offsetting requirements.</p>
2.13	<p>What would happen to the CORSIA emissions coverage if a State without an operator undertaking international flights decides to participate in the CORSIA offsetting?</p>
	<p>States without an operator flying international flights are encouraged to participate in all phases of the CORSIA. If such a State decides to participate, international flights to and from that State to other participating States are additionally included for the CORSIA's offsetting requirements, due to the route-based approach. The total international emissions covered by CORSIA offsetting would ultimately increase.</p>
	<p>Key design element 3: CORSIA offsetting requirements and eligible emissions units</p>
2.14	<p>What is offsetting and how does it work, in general?</p>
	<p>In general, offsetting is done through the purchase and cancellation of emissions units (see question 4.20), arising from different sources of emissions reductions achieved through mechanisms (e.g. UNFCCC's Clean Development Mechanism), programmes (e.g. REDD+) or projects (e.g. substituting coal-fired stoves with solar cookers). The buying and selling of eligible emissions units happens through carbon market. The price of the emissions units in the carbon market is influenced by the law of supply (availability of emissions units) and demand (level of offsetting requirements).</p> <p>“Cancelling” means the permanent removal and single use of an emissions unit so that the same emissions unit cannot be used more than once. This is done after an aeroplane operator has purchased emissions units from the carbon market.</p> <p>For CORSIA, an aeroplane operator is required to meet its offsetting requirements by cancelling CORSIA Eligible Emissions Units in a quantity equal to its total final offsetting requirements for a given compliance period. CORSIA Eligible Emissions Units <u>are to be determined by the ICAO Council</u>, and information on eligible units will be made available on the ICAO CORSIA website (see question 4.21).</p>
2.15	<p>How are an aeroplane operator's offsetting requirements calculated?</p>
	<p>Paragraph 11 of the Assembly Resolution A39-3 addresses the distribution of the total amount of CO₂ emissions to be offset in a given year among individual aeroplane operators. This is accomplished by introducing a dynamic approach for the distribution of offsetting requirements, which takes into account:</p>

- The Sector’s Growth Factor: represents the international aviation sector’s global average growth of emissions in a given year. It will be applied as a common factor for all individual operators participating in the scheme for the calculation of their offsetting requirements. ICAO will calculate the Sector’s Growth Factor every year based on the reported CO₂ emissions data from States to ICAO; and
- The Individual Growth Factor: represents an individual operator’s growth factor of emissions in a given year. This variable will start to be used from 2030 together with the Sector’s Growth Factor. It will increase gradually to represent more of an operator’s offsetting requirement.

Offsetting requirements will be calculated as follows:

- From 2021 through 2029 a 100 per cent sectoral approach (and 0 per cent individual approach) will be applied. This applies to the pilot phase, the first phase, and the first compliance period of the second phase.
- During the second compliance period of the second phase (2030 through 2032) at least 20 per cent of offsetting requirements would be calculated according to the “individual approach”. From 2033 to 2035, at least 70 per cent of offsetting requirements would be calculated according to the “individual approach”. In 2028, the Council will recommend to the Assembly whether and to what extent to adjust the individual percentage.

The sectoral/individual approach is applied from 2030, rather than from the start of the second implementation phase (2027), to provide for the equal treatment of the calculation of offsetting requirements between aeroplane operators participating in the first and second phase of the CORSIA.

Once the sector’s (and individual operator’s, if applicable) growth factor for a given year is being made available by ICAO, the State will calculate an operator’s CO₂ offsetting requirements by multiplying the operator’s annual emissions covered by CORSIA offsetting in the given year by the growth factor. Result of this calculation is the operator’s offsetting requirements for a given year. For each compliance period (see [question 2.16](#)), the State will sum up the offsetting requirements for each year within that compliance period, and the result will be the operator’s total offsetting requirement for that compliance period.

The figure below describes the calculation of an aeroplane operator’s offsetting requirements.

Operator’s annual emissions X Growth Factor = CO₂ offset requirements

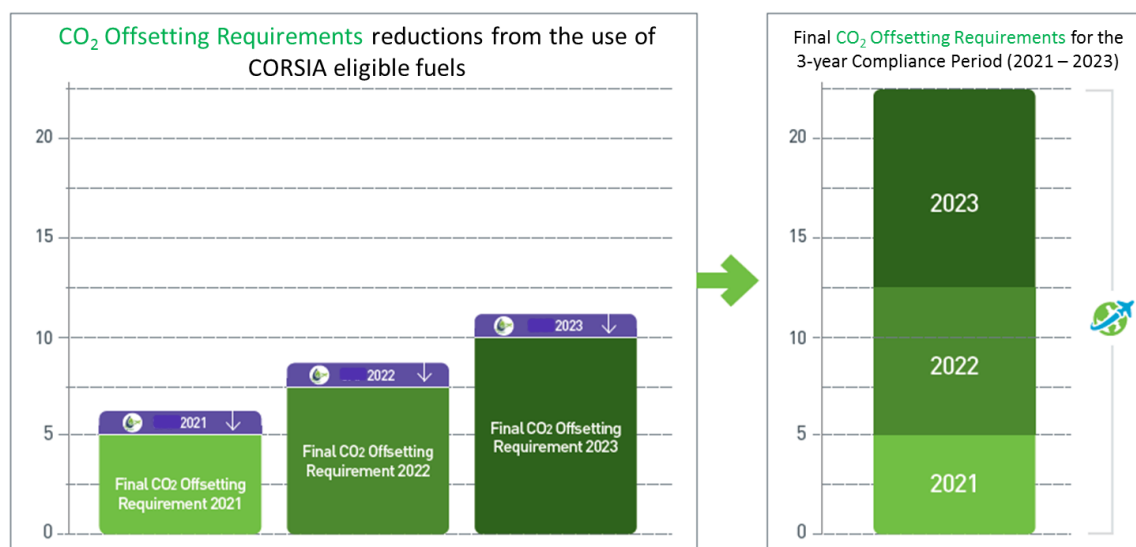

The Growth Factor changes every year taking into account both the sectoral and the individual operator’s emissions growth. The Growth Factor is the percent increase in the amount of emissions from the baseline to a given future year, and is calculated by ICAO.

2.16	<p>What are CORSIA’s compliance periods?</p> <p>Paragraph 16 of the Assembly Resolution A39-3 determines that CORSIA has three-years compliance cycles (also referred to as a compliance period), for which the operators need to reconcile their offsetting requirements. The compliance periods are:</p> <ul style="list-style-type: none"> • Compliance period 1: years 2021 – 2023; • Compliance period 2: years 2024 – 2026; • Compliance period 3: years 2027 – 2029; • Compliance period 4: years 2030 – 2032; • Compliance period 5: years 2033 – 2035. <p>It should be noted that an operator will report its CO₂ emissions on an annual basis, corresponding to calendar years. See question 3.67 for more information on the relationship between CORSIA’s compliance periods and reporting periods.</p>
2.17	<p>What are CORSIA’s baseline emissions?</p> <p>For the purposes of CORSIA, the sectoral baseline is defined as <u>the average of total CO₂ emissions for the years 2019 and 2020 on the routes covered by CORSIA offsetting in a given year from 2021 onwards.</u></p> <p>Paragraph 11(g) of the Assembly Resolution A39-3 notes that the sectoral baseline will be re-calculated when the routes included in the CORSIA change. This can happen, for example, when new States volunteer to participate or States decide to withdraw their voluntary participation. The recalculation of the baseline will be done by ICAO at the start of each year.</p>
2.18	<p>What is the difference between the Sector’s Growth Factor used by the formula under the CORSIA and the generally-used term “emission growth rate”?</p> <p>In general, the term “emissions growth rate” refers to the percentage increase in the amount of emissions from the baseline to a given year from 2021, <u>compared to the baseline emissions.</u></p> <p>For the purposes of CORSIA, the Sector’s Growth Factor is defined as the percentage increase in the amount of emissions from the baseline to a given year from 2021, <u>compared to the emissions in that given year.</u></p>
2.19	<p>How are CORSIA Eligible Fuels accounted for in the calculation of offsetting requirements?</p> <p>From 2021 onwards, operators can reduce their CORSIA offsetting requirements by claiming emissions reductions from CORSIA Eligible Fuels. In order to do this, the operator will:</p> <ul style="list-style-type: none"> • Use the amounts of CORSIA Eligible Fuels purchased, based on purchase records; • Use the life-cycle emissions values to determine emissions reduction factors for each CORSIA Eligible Fuel; • Obtain valid sustainability certification document; and • Report and claim verified reductions of its emissions from the use of CORSIA Eligible Fuels to the State. <p>The State will calculate the operator’s total final offsetting requirements at the end of each compliance period by subtracting the emissions reductions from the use of CORSIA Eligible Fuels from the operator’s offsetting requirements during the compliance period.</p> <p>The CORSIA Implementation Element "CORSIA Eligible Fuels" will provide the</p>

necessary methodologies to determine the emissions reductions from the use of CORSIA Eligible Fuels (see [questions 4.11 to 4.19](#) of these FAQs).

The figure below provides an illustration of accounting the benefits from CORSIA Eligible Fuels.

2.20 Can an aeroplane operator’s CO₂ offsetting requirements be negative?

Compliance periods for offsetting requirements are every 3 years, with the first period starting on 1 January 2021 and ending on 31 December 2023 (see also [question 2.16](#)).

If, as a result of the calculation described in [questions 2.15](#) and [2.19](#), an aeroplane operator’s total final offsetting requirements during a compliance period are negative (e.g., the verified emissions reductions claimed by an operator from the use of CORSIA Eligible Fuels are more than its offsetting requirements), the operator has no offsetting requirements for the compliance period.

Negative offsetting requirements will not be carried forward to a subsequent three-year compliance period. However, if an operator’s offsetting requirements in a given year within a compliance period are negative, the operator reduces its total final offsetting requirement for the three-year compliance period.

2.21 Will an aeroplane operator, which reduces its emissions compared to the baseline, have any offsetting requirements?

If an operator’s emissions do not increase or decrease compared to the baseline emissions, there will still be offsetting requirements for the operator, as long as the global emissions covered by CORSIA increase above the global baseline emissions (i.e. the Sector’s Growth Factor is positive).

Potential efforts of such an operator to renew its fleet and improve its operational efficiency will not be ignored, as the calculation of CORSIA offsetting requirements for the operator will be done by multiplying the Sector’s Growth Factor with the operator’s emissions covered by CORSIA offsetting requirements in a given year. Such efforts are reflected in the operator’s level of emissions, and offsetting requirements would be smaller than using the operator’s emissions without fleet renewal or operational improvements in the calculation. Therefore, the CORSIA maintains incentives for individual operators to make efforts to improve their fuel efficiency.

	<p>The incentive for individual aeroplane operators to reduce their emissions is further strengthened starting from 2030, when an individual aeroplane operator’s Growth Factor will be added to the offsetting requirements calculation formula. The individual Growth Factor represents an individual operator’s Growth Factor of emissions in a given year, and the weight of this factor in the formula of calculating the offsetting requirements will increase gradually to represent more of an operator’s offsetting requirement. Please see question 2.15 for more information.</p>
	<p>Key design element 4: Exemptions and new entrants</p>
2.22	<p>Does the CORSIA include provisions to exempt very low international aviation activities?</p>
	<p>Paragraph 13 of the Assembly Resolution A39-3 provides the following exemptions from the CORSIA offsetting requirements for the purposes of avoiding an administrative burden from the application of CORSIA due to low levels of international aviation activities:</p> <ol style="list-style-type: none"> 1. Aeroplane operators with a low level of annual emissions from their international aviation operations (less than 10 000 metric tonnes of CO₂ emissions per year); 2. Aircraft with less than 5 700 kg of Maximum Take Off Mass (MTOM); 3. Humanitarian, medical and firefighting operations. <p>In addition to being exempted from CORSIA offsetting requirements, these activities are also exempted from CORSIA MRV requirements (see question 3.19 for more information on the applicability of MRV requirements).</p>
2.23	<p>How will the CORSIA apply to operators that will initiate activities after the entry into force of the scheme (a so-called “new entrant”)?</p>
	<p>Paragraph 12 of the Assembly Resolution A39-3 refers to “new entrants” as aeroplane operators that commence an aviation activity falling within the scope of the CORSIA. This paragraph outlines criteria to determine when “new entrants” should start participating in the CORSIA offsetting, with the exemption period being the earliest out of the following two:</p> <ul style="list-style-type: none"> • Three years from commencing aviation activities within the scope of CORSIA; or • The year in which new entrant’s annual emissions exceed 0.1 per cent of total emissions in 2020. <p>In other words, new entrant is exempted from the application of the CORSIA offsetting requirements for the first 3 years, or until its annual emissions exceed 0.1% of total 2020 emissions from the international aviation sector. The condition that applies earlier will determine when a new entrant’s emissions are subject to the offsetting requirements.</p> <p>It is important to note that the CO₂ emissions of a new entrant are still to be reported from the year after the new entrant falls under the applicability of CORSIA MRV requirements (also see question 3.19), regardless of the exemptions from the CORSIA offsetting requirements.</p> <p>In the example below, operators A and B start operations in year 2022 as shown in the table. According to the Assembly Resolution A39-3, operator A will have offsetting requirements starting in 2025, and operator B in 2024. However, both operators will need to comply the MRV requirements from 2023 onwards, assuming that they are within the CORSIA MRV applicability.</p>

Operator	Emissions (% of total emissions in 2020)			
	2022	2023	2024	2025
A	0.02	0.04	0.06	0.08
B	0.06	0.11	0.16	0.21

2.24 Will a new entrant operator affect the CORSIA baseline?

CORSIA’s baseline is the average of CO₂ emissions from international aviation covered by the CORSIA offsetting for the years 2019 and 2020. As the CO₂ emissions of a new entrant are to be reported from the year after the CORSIA MRV system begins to apply to the operator (see [question 2.23](#)), emissions for year 2020 would be included in the CORSIA baseline, if the new entrant commences aviation activities and falls within the applicability of CORSIA MRV requirements in year 2019.

CAEP work is ongoing to produce recommendations for how to determine individual baseline emissions for new entrant aeroplane operators.

2.25 If an aeroplane operator, which (in the past) had domestic operations only, establishes international routes, will it be considered a new entrant?

According to the guidance provided in the Environmental Technical Manual, Volume IV, an aeroplane operator will be considered as a new entrant under CORSIA if the following conditions are met in such year:

- The aeroplane operator has not been within the scope of applicability of Annex 16, Volume IV, Part II, Chapter 2 in each year from 2019 until the year preceding the entry year; or
- None of the activities performed by the aeroplane operator are determined to be the continuation of activities previously performed by another aeroplane operator.

This could be interpreted in a way that an aeroplane operator does not actually need to be a newly created entity. Indeed, the entity can exist since many years without having operated any or a sufficient (in terms of CO₂ emissions on international routes) number of civil international flights. This would be the case for instance of a well-established aeroplane operator flying only domestic routes and then starting to operate on international routes.

Key design element 5: Review process

2.26 Does the CORSIA include provisions to review its implementation and to make adjustments if needed?

Paragraph 9 g) of the Assembly Resolution A39-3 includes a provision that the ICAO Council will conduct a review of the implementation of the CORSIA every three years, starting in 2022. This review will include an assessment of the impact of the CORSIA on the growth of international aviation. The results of this assessment will serve as an important basis for the Council to consider adjustments and make recommendations to the Assembly for decisions about the next implementation phase or compliance period, as appropriate.

In addition - as elaborated in paragraph 18 of the Assembly Resolution A39-3 - the purpose of the periodic review is to contribute to the sustainable development of the international aviation sector and to the effectiveness of the scheme. The review will assess, inter alia: the progress towards achieving ICAO's global aspirational goal, the scheme's market and cost impact on States and aeroplane operators and on international aviation, and the functioning of the scheme's design elements. The review will also involve consideration of the scheme's improvements that would support the purpose of the Paris Agreement or simply result in better design.

A special review will be performed by the end of 2032 regarding the termination of the scheme, its extension or any other post-2035 improvements.

The sequence of the phases of the CORSIA, compliance periods, periodic reviews, special review and ICAO Assemblies is summarized in the figure below.

	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035
Phases	Pilot Phase (voluntary, 3 years)			First Phase (voluntary, 3 years)			Second Phase (all non-exempted States, 9 years)								
Compliance cycles	Cycle 1 (3 years)			Cycle 2 (3 years)			Cycle 3 (3 years)			Cycle 4 (3 years)			Cycle 5 (3 years)		
Periodic reviews		Review 1			Review 2			Review 3			Review 4	Special			Review 5
Assemblies		A41			A42			A43			A44				A45

2.27 What are the methodologies and procedures for periodic reviews of CORSIA?

CAEP work is ongoing to produce recommendations for methodologies and procedures for the CORSIA periodic review, to be submitted to the ICAO Council, when requested.

3. Questions about Annex 16, Volume IV – CORSIA

General questions related to Annex 16, Volume IV

3.1 What are the differences between: Annex 16, Volume IV; Environment Technical Manual, Volume IV; and CORSIA Implementation Elements?

Annex 16, Volume IV and Environmental Technical Manual (ETM), Volume IV follow a similar structure to that of the Annex 16, Volumes I, II and III. This is the traditional ICAO Standards and Recommended Practices (SARPs) approach, where the implementation of the SARPs is supported by guidance material.

The SARPs of Annex 16, Volume IV provide the necessary actions by States or operators (the “what” and “when”) to implement CORSIA, whereas the Environmental Technical Manual (ETM), Volume IV provides the guidance on the process (the “how”) to implement CORSIA.

Due to CORSIA's specific characteristics, CORSIA Implementation Elements are also being developed. The Implementation Elements are reflected in 14 ICAO documents, which are directly referenced in the SARPs and contain essential information for the implementation of CORSIA. These ICAO documents will be available on the ICAO CORSIA website, once approved by the ICAO Council, and may only be amended by the ICAO Council.

3.2 What ICAO process was followed to develop Annex 16, Volume IV?

Following the adoption of Assembly Resolution A39-3, the ICAO Council in November 2016 endorsed the overall plan of CORSIA preparatory activities on the development of CORSIA-related SARPs and guidance. The Council also established an Advisory Group on CORSIA (AGC) to serve as an advisory body to the Council. CAEP was tasked to develop recommendations for CORSIA-related SARPs and guidance.

	<p>Following CAEP’s recommendation, preliminary reviews by the AGC and ICAO’s Air Navigation Commission (ANC), consultation with Member States, and the final reviews by AGC and ANC, the CORSIA-related SARPs were adopted by the Council on 27 June 2018 in the form of Annex 16 — <i>Environmental Protection to the Convention on International Civil Aviation, Volume IV — Carbon Offsetting and Reduction Scheme for International Aviation (CORSA)</i>.</p>
	Administrative aspects
3.3	<p>What is the definition of international flight for CORSIA purposes?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.1.2.</i></p> <p>For the purposes of CORSIA, an international flight is defined as the operation of an aircraft from take-off at an aerodrome of a State or its territories, and landing at an aerodrome of another State or its territories.</p>
3.4	<p>What guidance should be followed to determine whether a flight is international or domestic?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.1.2.</i></p> <p>For the purposes of CORSIA, an international flight is defined as the operation of an aircraft from take-off at an aerodrome of a State or its territories, and landing at an aerodrome of another State or its territories (see also question 3.3).</p> <p>When considering whether a flight is international or domestic for the purposes of CORSIA, an aeroplane operator and a State should use Doc 7910 — <i>Location Indicators</i>, which contains a list of aerodromes and the State they are attributed to.</p>
3.5	<p>Does CORSIA apply to international flights to/from non-ICAO States?</p> <p><i>Reference: Environmental Technical Manual, Volume IV, Chapter 2, 2.1.1</i></p> <p>CORSIA is implemented through Annex 16, Volume IV to the Convention on International Civil Aviation (Chicago Convention), which applies to Contracting States of the Convention. Flights taking off from or landing at an aerodrome of a State, or one of its territories, that is not an ICAO Member State are not considered to fall within the applicability scope of Annex 16, Volume IV.</p>
3.6	<p>What is the definition of an "aeroplane" in CORSIA? How does this definition differ from the definition of an "aircraft"?</p> <p><i>Reference in Annex 16, Volume IV: Part I, Chapter 1, Definitions.</i></p> <p>The following definition of “an aeroplane” is included in the Annex 16, Volume IV: Aeroplane. A power-driven heavier-than-air aircraft, deriving its lift in flight chiefly from aerodynamic reactions on surfaces which remain fixed under given conditions of flight.</p> <p>Regarding the difference between the definitions of an aircraft and an aeroplane, Annex 2 to the Convention on International Civil Aviation offers the following definition for “an aircraft”: Aircraft. Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth’s surface.</p> <p>Under CORSIA, only aeroplane operators will have compliance requirements (see also question 3.25).</p>
3.7	<p>What is the definition of “an aerodrome” in CORSIA?</p> <p><i>Reference in Annex 16, Volume IV: Part I, Chapter 1, Definitions.</i></p>

	<p>Annex 16, Volume IV offers the following definition for “an aerodrome”: Aerodrome. A defined area on land or water (including any buildings, installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of aircraft.</p>
3.8	<p>How are diverted flights handled in CORSIA?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.1.</i></p> <p>Diversion of flights can lead to any of the following scenarios:</p> <ol style="list-style-type: none"> A flight originally subject to MRV requirements, which continues to be subject to such requirements as a result of the diversion; A flight originally not subject to MRV requirements, which continues not to be subject to such requirements as a result of the diversion; A flight originally subject to MRV requirements, which is no longer subject to such requirements as a result of the diversion; or A flight originally not subject to MRV requirements, which becomes subject to such requirements as a result of the diversion. <p>Under CORSIA, in any of the scenarios listed above, the actual aerodromes of departure and arrival for a flight, rather than the scheduled ones, will be taken as a reference to determine whether or not that flight is subject to MRV requirements. See also question 3.29.</p>
3.9	<p>What does a “State pair” mean? Is it uni- or bidirectional?</p> <p><i>Reference in Annex 16, Volume IV: Part I, Chapter 1, Definitions.</i></p> <p>In CORSIA, State pair is being defined as a group of two States composed of a departing State or its territories and an arrival State or its territories. For example, when reporting CO₂ emissions from international flights between States A and B, an aeroplane operator will report both directions as separate State pairs (A-B and B-A).</p>
3.10	<p>Who will ensure that aeroplane operators comply with the requirements of Annex 16, Volume IV?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.3.1.</i></p> <p>According to Assembly Resolution A39-3, paragraph 20 j), ICAO Member States will take necessary action to ensure that the national policies and regulatory framework be established for the compliance and enforcement of CORSIA.</p> <p>As per Annex 16, Volume IV, an aeroplane operator will be attributed to a State for administering CORSIA based on the rules for attribution (see question 3.12). The State is primarily responsible for ensuring that the aeroplane operator complies with the CORSIA requirements.</p>
3.11	<p>How is an international flight being attributed to a single aeroplane operator?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.1.3.</i></p> <p>It is important to identify all applicable international flights so that the CO₂ emissions from these flights are monitored and reported. Also, each international flight should be allocated to a single aeroplane operator without duplication. In order to achieve this, the following information will be used for attributing international flights to an aeroplane operator:</p> <ul style="list-style-type: none"> ICAO Designator: When Item 7 (aircraft identification) of the flight plan contains the ICAO Designator, that flight shall be attributed to the aeroplane operator that has been assigned this Designator;

	<ul style="list-style-type: none"> • Registration marks: When Item 7 (aircraft identification) of the flight plan contains the nationality or common mark, and registration mark of an aeroplane that is explicitly listed in an air operator certificate (AOC) (or equivalent) issued by a State, that flight shall be attributed to the aeroplane operator that holds the AOC (or equivalent); or • Other: When the aeroplane operator of a flight has not been identified via previous points, that flight shall be attributed to the aeroplane owner who shall then be considered the aeroplane operator.
3.12	How is an aeroplane operator being attributed to a single State?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.2.</i></p> <p>Under CORSIA, each aeroplane operator will report its CO₂ emissions to a single State. The rules for attributing an aeroplane operator to a State are based on:</p> <ul style="list-style-type: none"> • ICAO Designator: Where the aeroplane operator has an ICAO Designator, the State to which the aeroplane operator fulfils its requirements under CORSIA shall be the Notifying State of the Designator; • Air operator certificate: Where the aeroplane operator does not possess an ICAO Designator, but has a valid air operator certificate (or equivalent), the State to which the aeroplane operator fulfils its requirements under CORSIA shall be the State that issued the air operator certificate (or equivalent); or • Place of juridical registration: Where the aeroplane operator does not possess an ICAO Designator or air operator certificate, the State where the aeroplane operator is registered as juridical person shall be the State to which the aeroplane operator fulfils its requirements under CORSIA. Where the aeroplane operator is a natural person, the State of residence and registration of this person shall be the State to which the aeroplane operator fulfils its requirements under CORSIA. <p>The State is required to ensure the correct attribution of an aeroplane operator to it. In order to determine which aeroplane operators fall under its administration, the State should take the following steps: review operators’ possible communications indicating that are likely to be administered by the State, review the contents of Doc 8585 — <i>Designators for Aircraft Operating Agencies, Aeronautical Authorities and Services</i>, and identify those operators that are notified by the State, review AOCs issued by that State, and review of registered entities within that particular State (e.g., from the State’s company register).</p> <p>It should be noted that the “place of juridical registration” refers to the State in which the entity (company or person) is legally registered. The purpose is to have jurisdictional clarity in cases of enforcement, such as international court measures. The place of juridical registration may differ from the principal place of business.</p> <p>Regarding the use of the expression “AOC (or equivalent)”, the wording “or equivalent” is used because in some States the AOC is named differently. The “AOC” refers to an official document issued by a State that gives an aeroplane operator license to operate and that contains the identification of the aircraft operator and may also contain aircraft registration marks. The use of general aviation operating certificates and other certificates permitting non-commercial air transport could thus be appropriate as long as these certificates are issued/approved by a State.</p> <p>After identifying the aeroplane operators under its administration, the State is required to submit to ICAO information of those aeroplane operators that are attributed to it,</p>

	and ICAO will publish a list of aeroplane operators and the States attributions on the ICAO CORSIA website, as a part of the ICAO document entitled “CORSIA Central Registry (CCR): Information and Data for Transparency”.
3.13	Can an aeroplane operator delegate its administrative requirements?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.1.5.</i></p> <p>Yes, an aeroplane operator can delegate its CORSIA administrative requirements to a third party. However, this third party cannot be the same entity as the verification body. Also, liability for compliance with the CORSIA requirements will remain with the aeroplane operator.</p>
3.14	Can an aeroplane operator report together with one or more of its subsidiaries?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.2.6.</i></p> <p>An aeroplane operator can report together with a subsidiary aeroplane operator, if the subsidiary is:</p> <ul style="list-style-type: none"> • Wholly owned by the parent company; and • Legally registered in the same State as the parent company. <p>If both conditions are met, an aeroplane operator with a subsidiary aeroplane operator can be treated as a single consolidated aeroplane operator liable for compliance with CORSIA requirements. Such an arrangement is subject to the approval of the State, and evidence shall be provided in the aeroplane operator’s Emissions Monitoring Plan to demonstrate that the subsidiary aeroplane operator is wholly owned.</p> <p>If two aeroplane operators are treated as a single consolidated aeroplane operator, the two operators will be administered as a single entity, and their emissions aggregated. Therefore, the applicability of the requirements of Annex 16, Volume IV will be based on their aggregated emissions.</p>
3.15	Who is responsible for reporting emissions from flights operated with leased aeroplanes?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.1.2.</i></p> <p>According to Annex 16, Volume IV, the attribution of international flights to an operator is based on the Flight Plan, Item 7, which means that the operating entity (i.e. in a case of wet-lease arrangement, the lessee) is responsible for the international flights (under the lessee’s ICAO Designator) and therefore responsible for compliance of the international flights attributed to the lessee.</p> <p>In addition, the State of the lessee is responsible for administrative tasks related to lessee, for example approval of the lessee’s Emissions Monitoring Plan and Emissions Report.</p>
3.16	Can a State delegate its administration processes under the CORSIA to another State?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.3.2.</i></p> <p>Yes, a State may delegate administration processes of CORSIA to another State through an administrative partnership based on a bilateral agreement between the respective States. Nevertheless, the State shall not delegate enforcement of CORSIA requirements, or its administrative tasks towards ICAO, to another State.</p> <p>If such an arrangement is agreed upon, the State receiving capacity support must ensure that aeroplane operators attributed to that State are advised of the administrative arrangements.</p>
3.17	How long does a State and an aeroplane operator need to keep CORSIA-related

	records? What is included in those records?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.4, and Appendix 4.</i></p> <p>An aeroplane operator is required to keep records relevant to demonstrating compliance with the requirements of Chapters 2, 3, and 4 of Annex 16, Volume IV, Part II, for a period of 10 years. It is also recommended that an aeroplane operator keep records relevant to its CO₂ emissions per State pair during the 2019-2020 period in order to allow the operator to cross-check its offsetting requirements calculated by the State during the 2030-2035 compliance periods, when the operator's Individual Growth Factor will be applied in calculating the offsetting requirements.</p> <p>An operator is required to include a documentation and record keeping plan in its Emissions Monitoring Plan for the approval by the State. This plan will specify how (e.g., by using an IT system), and where the operator will store CORSIA-relevant information.</p> <p>The State shall keep records relevant to the aeroplane operator's CO₂ emissions per State pair during the period of 2019-2020 in order to calculate the aeroplane operator's offsetting requirements during the 2030-2035 compliance periods.</p>
	Monitoring, reporting and verification (MRV) in general
3.18	What are the components of the CORSIA MRV system?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2.</i></p> <p>CORSIA's MRV (Monitoring, Reporting and Verification) system consists of three components:</p> <ul style="list-style-type: none"> • <u>Monitoring</u> of CO₂ emissions is either based on a Fuel Use Monitoring Method, or the on use of the ICAO CORSIA CERT (see question 3.40). For the former, each operator has to collect accurate information on the fuel use per each flight and calculate CO₂ emissions by multiplying the amount of fuel used with a conversion factor representing the amount of tonnes of CO₂ produced from using one tonne of fuel. An aeroplane operator is required to describe its approach to CO₂ emissions monitoring in an Emissions Monitoring Plan (see question 3.30), which the operator will submit for approval by the State. • After monitoring and calculating CO₂ emissions, the necessary information will be <u>reported</u> from aeroplane operators to their State Authority, and from States to ICAO, by using harmonized templates and procedures. ICAO consolidates the CO₂ emissions data, calculates the annual Sectoral Growth Factor, and communicates the Growth Factor to States. • <u>Verification</u> of CO₂ emissions information is to ensure that the data is accurate and free of errors. A very basic idea of verification is that a third party checks that everything has been done correctly. This is similar to the accounting practices that are performed in the financial world.
3.19	What is the applicability of the CORSIA MRV requirements? Are there any exemptions?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.1.</i></p> <p><u>All aeroplane operators</u> conducting international flights are required to monitor, report and verify CO₂ emissions from these flights from 1 January 2019 until 31 December 2035. It should be noted that the requirement for the MRV of CO₂ emissions is independent from participation in CORSIA offsetting.</p> <p>As per Annex 16, Volume IV, the MRV requirements <u>do not</u> apply to:</p>

	<ul style="list-style-type: none"> • An aeroplane operator that produces annual CO₂ emissions from international flights less than or equal to 10 000 tonnes; • Aeroplane(s) with a maximum certificated take-off mass less than or equal to 5 700 kg; • Humanitarian, medical and firefighting flights, as well as flights preceding or following a humanitarian, medical or firefighting flight, provided that such flights were conducted with the same aeroplane, and were required to accomplish the related humanitarian, medical or firefighting activities or to reposition thereafter the aeroplane for its next activity.
3.20	Can an aeroplane operator with emissions of less than 10 000 tonnes of CO ₂ per year be included in CORSIA?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.2.6, Chapter 2, 2.1.</i></p> <p>An aeroplane operator that produces annual CO₂ emissions from international flights less than or equal to 10 000 tonnes is not subject to the requirements of Annex 16, Volume IV (see also question 3.19).</p> <p>However, if an aeroplane operator below the threshold of 10 000 tonnes of CO₂ is wholly-owned by and legally registered in the same State as another aeroplane operator, the two aeroplane operators can request to be treated as a single operator (see question 3.14). In this case the combined emissions of both aeroplane operators could exceed this threshold and become subject to the applicability of the MRV requirements of CORSIA.</p>
3.21	What are the actions for an aeroplane operator, who has been covered by CORSIA, but now drops below the 10 000 tonnes of CO ₂ threshold?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.1.</i></p> <p>If an aeroplane operator falls below the 10 000 tonnes threshold in a given year, then it falls outside the scope of applicability of Annex 16, Volume IV and would not have any requirements in that year. In such an instance, it is suggested the aeroplane operator contact its State of attribution to inform them that they are below the threshold. The State may choose to engage with the operator to confirm that the aeroplane operator is out of the scope of applicability.</p>
3.22	How to address aeroplane operators with annual CO ₂ emissions close to the 10 000 tonnes threshold?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.1.</i></p> <p>If an aeroplane operator is close to the 10 000 tonnes threshold of annual CO₂ emissions, it should consider engaging with the State for guidance. Likewise, the State should carry out oversight of the aeroplane operators attributed to it, and engage with any that it considers may be close to or above the threshold. The aeroplane operator with annual CO₂ emissions below the threshold may also choose to voluntarily engage with the State to which it is attributed (e.g. to declare that the operator's emissions are below the threshold).</p>
3.23	Are aeroplane manufacturers or airports subject to any requirements under Annex 16, Volume IV?
	No, aeroplane manufacturers and airports do not have requirements under Annex 16, Volume IV, unless those entities operate international flights themselves, and thus become aeroplane operators as defined in Annex 16, Volume IV.
3.24	Is a re-positioning flight before or after an exempted humanitarian, medical or firefighting flight exempt?
	<i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.1.</i>

	<p>Yes. Flights preceding or following a humanitarian, medical or firefighting flights are also exempt if they were required to accomplish the humanitarian, medical or firefighting activities or to reposition the aeroplane thereafter. The operator will have to be able to provide evidence of the nature of the flight. See also question 3.19.</p>
3.25	<p>Are helicopter operations covered by the CORSIA MRV system?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.1.</i></p> <p>No. The applicability of the CORSIA MRV requirements covers aeroplanes, and helicopter operations are outside of the scope of applicability of CORSIA. See also question 3.6.</p>
3.26	<p>Are international flights by police, military, customs or State aircraft within the scope of applicability of the CORSIA MRV system?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.1.</i></p> <p>No, Annex 16, Volume IV only applies to international civil aviation; international flights from police, military, customs and State aircraft are excluded from the Chicago Convention as per Article 3, and thus are excluded from the scope of CORSIA.</p>
3.27	<p>How can humanitarian, medical, firefighting, police, military, customs and State aircraft flights be identified?</p> <p><i>Reference: Environmental Technical Manual, Volume IV, Chapter 2, 2.1.4.</i></p> <p>An aeroplane operator should provide evidence to the State to which it has been attributed to prove that an operation was a humanitarian, medical, firefighting, military or State aeroplane flight. Information included in Item 8 (flight rules and type of flight) of the flight plan can be used to demonstrate the nature of a flight, and the ETM, Volume IV provides examples of specific marks that can be included in the Flight Plan in this regard, as per Doc 4444 — <i>Procedures for Air Navigation Services — Air Traffic Management</i>.</p> <p>It should be noted that a State might have in place specific procedures and practices to demonstrate humanitarian, medical, firefighting, police, military, customs and State aircraft flights. The decision to interpret whether a flight is under the applicability of Annex 16, Volume IV is on the State Authority. Procedures for identifying international flights that are exempted from CORSIA’s applicability should be provided within the Emissions Monitoring Plan approved by the State Authority.</p>
3.28	<p>Are Search and Rescue (SAR) flights exempted from CORSIA?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.1.</i></p> <p>As per Annex 16, Volume IV, the MRV requirements do not apply to:</p> <ul style="list-style-type: none"> • An aeroplane operator that produces annual CO₂ emissions from international flights less than or equal to 10 000 tonnes; • Aeroplane(s) with a maximum certificated take-off mass less than or equal to 5 700 kg; • Humanitarian, medical and firefighting flights, as well as flights preceding or following a humanitarian, medical or firefighting flight, provided that such flights were conducted with the same aeroplane, and were required to accomplish the related humanitarian, medical or firefighting activities or to reposition thereafter the aeroplane for its next activity. <p>Annex 16, Volume IV does not specifically exclude international Search and Rescue flights from the applicability of CORSIA, unless such flights are categorized under one</p>

	of the above mentioned categories.
3.29	How are diversions handled in CORSIA?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.1.2; Chapter 2, 2.1.; Chapter 2, 2.2.1.3.3.</i></p> <p>A flight should be considered to be diverted when it makes an unplanned landing at an aerodrome different from the destination aerodrome indicated by the aeroplane operator in the last approved flight plan filed prior to the flight departure.</p> <p>A diverted flight and the subsequent flight are to be treated as two consecutive and separate flights operating, respectively, to and from the aerodrome the diverted flight actually landed at, rather than that which was originally planned.</p> <p>A diversion is by its nature unplanned. However, according to the rules of CORSIA, whether a flight is international, or subject to an offsetting requirements, is based on where it actually went, not where it meant to go.</p> <p>If in a given year an aeroplane operator is subject to the CORSIA offsetting requirements only because of diverted or subsequent flights (all other flights being operated on routes not subject to offsetting), the aeroplane operator will still be required to offset the emissions of those flights.</p> <p>Should an aeroplane operator that is approved to use the ICAO CORSIA CERT exceed in a given year the threshold of 50 000 tonnes of CO₂ on the routes subject to offsetting requirements due to diverted or subsequent flights, then the operator will still be permitted to use the ICAO CORSIA CERT in that year and the following year (year y+1). However, if the operator also exceeds the 50 000 tonnes threshold in that following year (year y+1), then it would be required to submit a new Emissions Monitoring Plan by 30th September in (Year y+2) and begin using a Fuel Use Monitoring Method from 1st January in Year y+3.</p>
	Emissions Monitoring Plan
3.30	What is an Emissions Monitoring Plan and why is it needed?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.2 and Appendix 4.</i></p> <p>An aeroplane operator falling under the applicability of CORSIA MRV requirements is required to submit an Emissions Monitoring Plan to the State Authority for approval. An Emissions Monitoring Plan is a collaborative tool between the State and the aeroplane operator that identifies the most appropriate means and methods for CO₂ emissions monitoring on an operator-specific basis, and also facilitates the reporting of required information to the State.</p> <p>During the development and approval process of the Emissions Monitoring Plan, the State Authority and aeroplane operator should maintain clear and open communication. Working collaboratively for CORSIA preparation and implementation reduces potential errors and increases effectiveness of the CO₂ emissions monitoring.</p>
3.31	What are the contents of an Emissions Monitoring Plan?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.2 and Appendix 4.</i></p> <p>An Emissions Monitoring Plan has four main components:</p> <ul style="list-style-type: none"> • Aeroplane operator identification; • Fleet and operations data; • Methods and means of calculating emissions from international flights; and

	<ul style="list-style-type: none"> Data management, data flow and control. <p>Full contents of an Emissions Monitoring Plan are included in Annex 16, Volume IV, Appendix 4.</p>
3.32	<p>Is there a standardized template for an Emissions Monitoring Plan?</p> <p>A template for an Emissions Monitoring Plan is provided in the <i>Environmental Technical Manual</i> (Doc 9501), Volume IV – <i>Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)</i>.</p> <p>The template is also available on the ICAO CORSIA webpage (https://www.icao.int/environmental-protection/CORSIA/Pages/Templates.aspx).</p>
3.33	<p>When should an aeroplane operator submit an Emissions Monitoring Plan to the State?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.2 and Appendix 1.</i></p> <p>Annex 16, Volume IV requires that aeroplane operators submit their Emissions Monitoring Plan to their State for approval by 28 February 2019. It is also recommended that, if possible, aeroplane operators submit their Emissions Monitoring Plans by 30 September 2018 in order to support implementation of emissions monitoring from 1 January 2019.</p>
3.34	<p>When will the Emissions Monitoring Plan be approved by the State?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.2 and Appendix 1.</i></p> <p>After receiving the Emissions Monitoring Plan from the aeroplane operator, the State Authority will review the plan. If the plan meets the requirements of Annex 16, Volume IV, then the State Authority will approve the Emissions Monitoring Plan. Guidance for the review and approval of an Emissions Monitoring Plan is included in the <i>Environmental Technical Manual</i> (Doc 9501), Volume IV – <i>Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)</i>.</p> <p>The recommended timeframe for State approval is by 30 November 2018 (if the aeroplane operator has submitted the plan by 30 September 2018). A deadline for approval is by 30 April 2019 (if the aeroplane operator has submitted the Plan by 28 February 2019).</p>
3.35	<p>Does the third-party verification body need to review the Emission Monitoring Plan prior to its review and approval by the State?</p> <p><i>Reference in Annex 16, Volume IV: Part I, Chapter 1, 1.1.5.</i></p> <p>No. An Emissions Monitoring Plan is a tool to facilitate CORSIA-related communication between an aeroplane operator and a State Authority, and it does not need to be verified by a third-party verification body.</p> <p>A verification body is required to conduct the <u>verification of an Emissions Report</u> that the aeroplane operator develops in accordance with the approved Emissions Monitoring Plan.</p>
3.36	<p>What happens if an aeroplane operator does not have an approved Emissions Monitoring Plan on 1 January 2019?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.1.2.</i></p> <p>An aeroplane operator should prepare and submit an Emissions Monitoring Plan as soon as possible after becoming subject to the applicability of the CORSIA MRV</p>

	<p>requirements. According to Annex 16, Volume IV, if the aeroplane operator does not have an approved Emissions Monitoring Plan as of 1 January 2019, it shall monitor and record its CO₂ emissions in accordance with the eligible monitoring method outlined in the Emissions Monitoring Plan that it will submit, or has submitted, to the State to which it is attributed.</p>
3.37	<p>Does the Emissions Monitoring Plan have to be submitted annually?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.2.</i></p> <p>No. The Emissions Monitoring Plan has to be submitted only once unless there are material changes to the operator’s procedures in which case the operator will have to re-submit the Emissions Monitoring Plan to the State Authority for approval.</p>
3.38	<p>What happens if there are changes to the information contained in an Emissions Monitoring Plan?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.2.</i></p> <p>In general, an Emissions Monitoring Plan should reflect the current status of an aeroplane operator’s operations. An operator is required to resubmit the Plan for review and approval by the State if a “material change” is made to the information contained within the Plan. Examples of a material change include:</p> <ul style="list-style-type: none"> • A change to the information presented in the Plan that would affect the status or eligibility of an aeroplane operator for an option under the emissions monitoring requirements; • A change that would otherwise affect the decision by the State with regards to whether the aeroplane operator’s approach to monitoring conforms with the requirements; or • A change in the identifying information for attributing the aeroplane operator to a State, or a change in the means for having international flights attributed to the operator. <p>The aeroplane operator is also required to inform the State of changes that would affect the State’s oversight. This applies even if the changes do not fall within the definition of a material change. Examples of such changes include a change in corporate name or address, or a change in the contact information for a person responsible for the operator’s Emissions Monitoring Plan.</p> <p>Guidance on identifying material changes to an Emissions Monitoring Plan is provided in the <i>Environmental Technical Manual (Doc 9501), Volume IV – Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSA)</i>.</p>
3.39	<p>How should non-material changes to an Emissions Monitoring Plan be communicated to the State?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.2.</i></p> <p>An aeroplane operator is required to inform the State of changes that would affect the State’s oversight, including changes that do not fall within the definition of a material change (see question 3.38). As per Annex 16, Volume IV, the operator shall include as a part of its Emissions Monitoring Plan the procedures for providing notice in the Emissions Report of non-material changes that require the attention of the State.</p> <p>Guidance on identifying material and non-material changes to an Emissions Monitoring Plan is provided in the <i>Environmental Technical Manual (Doc 9501), Volume IV – Procedures for demonstrating compliance with the Carbon Offsetting</i></p>

	<i>and Reduction Scheme for International Aviation (CORSA).</i>
	Monitoring
3.40	How does an aeroplane operator monitor its fuel use and CO ₂ emissions?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.2. Appendix 2, and Appendix 3.</i></p> <p>Under CORSIA, there are two possible ways of monitoring the CO₂ emissions: either by tracking the fuel use by applying one of the five Fuel Use Monitoring Methods and then calculating CO₂ emissions from the fuel use, or by using the ICAO CORSIA CO₂ Estimation and Reporting Tool (CERT). Aeroplane operator’s level of activity (see below for the activity thresholds) will determine whether the operator is eligible to use the ICAO CORSIA CERT, or it is required to apply a Fuel Use Monitoring Method. An aeroplane operator will select an appropriate method and include the selection in its Emissions Monitoring Plan, for submission to the State for approval.</p> <p>An aeroplane operator with annual CO₂ emissions from international flights of less than 500 000 tonnes during the period of 2019-2020 can use the ICAO CORSIA CERT for estimating and reporting its CO₂ emissions under CORSIA (see question 3.42 for more information about the ICAO CORSIA CERT).</p> <p>An aeroplane operator with annual CO₂ emissions from international flights of more than or equal to 500 000 tonnes during the period of 2019-2020 is required to choose one of the five eligible “Fuel Use Monitoring Methods”. The five Eligible Fuel Use Methods are described more in details in Annex 16, Volume IV, Appendix 2 (see also question 3.45).</p> <p>For the period of 2021-2035, the eligibility threshold for the use of the ICAO CORSIA CERT changes. For this period, an aeroplane operator can use ICAO CORSIA CERT to estimate and report its annual CO₂ emissions, if the operator’s emissions from international flights subject to offsetting requirements are less than 50 000 tonnes. Also, an operator can still use the ICAO CORSIA CERT to estimate and report those CO₂ emissions from international flights not covered by offsetting requirements.</p>
3.41	Who approves the monitoring method for an aeroplane operator?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.1.</i></p> <p>An aeroplane operator shall monitor and record its fuel use from international flights in accordance with an eligible monitoring method, and as approved by the State to which it is attributed. It is the responsibility of the State to approve an appropriate monitoring method for an operator, as a part of the approval of the operator’s Emissions Monitoring Plan.</p>
3.42	Who are eligible to use the ICAO CORSIA CO ₂ Estimation and Reporting Tool (CERT)?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.2, and Appendix 3.</i></p> <p>Assembly Resolution A39-3 requested the development of simplified MRV procedures as a part of the CORSIA MRV system. ICAO CORSIA CERT is a simplified tool that is designed to help aeroplane operators to estimate and report their international aviation emissions.</p> <p><u>All</u> aeroplane operators can use the ICAO CORSIA CERT for a preliminary CO₂ assessment to support the determination of an appropriate eligible method for the monitoring of the CO₂ emissions.</p>

	Eligible aeroplane operators can use ICAO CORSIA CERT for estimating and reporting of their annual CO ₂ emissions (see question 3.40 for the eligibility criteria for using the ICAO CORSIA CERT).
3.43	Where can one access the ICAO CORSIA CERT?
	ICAO CORSIA CERT is available free of charge on the ICAO CORSIA webpage .
3.44	Where can one find more information about ICAO CORSIA CERT?
	Please refer to section 4 of these FAQs for more information on ICAO CORSIA CERT.
3.45	What are the five Eligible Fuel Use Monitoring Methods? Are they different from ICAO CORSIA CERT?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.2, and Appendix 2.</i></p> <p>Not all aeroplane operators are eligible to use the ICAO CORSIA CERT for estimating and reporting their annual CO₂ emissions (see question 3.40). Operators which are ineligible to use the ICAO CORSIA CERT shall select and use one of the five Eligible Fuel Use Monitoring Methods.</p> <p>The five methods are entitled as “Method A”; “Method B”; “Block-off / Block-on”; “Fuel Uplift”; and “Fuel Allocation with Block Hour”, and are described in details in Annex 16, Volume IV, Appendix 2, as well as in the <i>Environmental Technical Manual</i> (Doc 9501), Volume IV – <i>Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)</i>. These five methods represent the most accurate established practices, and are equivalent; there is no hierarchy for selecting one method. Providing five methods is to allow flexibility for the operator to choose a method that best fits its existing fuel use tracking procedures.</p> <p>The differences in results between the five Fuel Use Monitoring Methods are not significant, in particular over a full reporting period. A comparison of the methods performed by CAEP experts demonstrated that there are no major differences between the results of the methods for the purpose of CORSIA.</p> <p>An aeroplane operator can use a different Fuel Use Monitoring Method for different aeroplane types included in its fleet. The aeroplane operator is required to specify in its Emissions Monitoring Plan which method it will apply to which aeroplane type. Aeroplane types are included in Doc 8643 — <i>Aircraft Type Designators</i> (https://www.icao.int/publications/DOC8643/Pages/Search.aspx).</p> <p>It should be noted that if the aeroplane operator wants to change its monitoring method, this change must be reflected in the Emissions Monitoring Plan, and approved by the State Authority before the operator can start applying the new monitoring method (also see question 3.38)</p> <p>Difference between a Fuel Use Monitoring Method, and ICAO CORSIA CERT is that, a Fuel Use Monitoring Method <u>tracks the quantity of fuel</u> for each flight. ICAO CORSIA CERT is <u>an emissions estimation tool</u> to calculate CO₂ emissions based on the aeroplane type and aerodromes of origin and destination.</p>
3.46	Is it necessary to describe all five Fuel Use Monitoring Methods in the Emissions Monitoring Plan, even if not all are used?
	No, an operator needs to describe only those methods that it will use for the fuel use monitoring; there’s no need to describe all five methods in the Emissions Monitoring

	Plan (also see question 3.45).
3.47	Is it possible to use a Fuel Use Monitoring Method for reporting that is different to the method(s) described in the approved Emissions Monitoring Plan?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.2.</i></p> <p>An Emissions Monitoring Plan should reflect the current status of an aeroplane operator’s operations, including the current monitoring method.</p> <p>If there is a change to the monitoring method, this would constitute a “material change” to the Emissions Monitoring Plan, and the operator would be required to resubmit the Plan for review and approval by the State (also see question 3.45).</p>
3.48	Can an aeroplane operator change its Fuel Use Monitoring Method?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.1.1. and 2.2.1.2.</i></p> <p>Yes. An aeroplane operator can change its fuel monitoring method. However, an operator must use the same eligible monitoring method for the entire compliance period. In addition, an operator is recommended to use the same monitoring method for the 2019 – 2020 period that it expects to use during the 2021 – 2023 period.</p> <p>If an operator changes a monitoring method, this constitutes a material change to the Emissions Monitoring Plan, and the operator will need to submit a revised Emissions Monitoring Plan to the State for approval (also see question 3.45).</p>
3.49	Can an aeroplane operator use several different Fuel Use Monitoring Methods?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.1.3, and Appendix 4.</i></p> <p>An aeroplane operator can use different Fuel Use Monitoring Methods for different aeroplane types included in the operator’s fleet. If different methods are to be used for different aeroplane types, then the operator shall specify in its Emissions Monitoring Plan which method applies to which aeroplane type. Approving appropriate monitoring method(s) for an operator is the responsibility of the State, as a part of the approval of the operator’s Emissions Monitoring Plan.</p> <p>Also, during the period of 2021 – 2035, an aeroplane operator is entitled to use either a Fuel Use Monitoring Method or the ICAO CORSIA CERT for international flights not subject to offsetting requirements. This might lead into a situation where the operator is using a Fuel Use Monitoring Method for international flights subject to offsetting requirements, and ICAO CORSIA CERT for international flights not subject to offsetting requirements (also see questions 3.40 and 3.45).</p>
3.50	How is “Block-off” and “Block-on” defined in Fuel Use Monitoring Method “Block-off / Block-on”?
	<p><i>Reference in Annex 16, Volume IV: Appendix 2, 2.4.</i></p> <p>Block-off: any time between last door closed and first engine on. Any deviation to this definition should be in accordance with the aeroplane operator’s existing operational practices as defined in the Emissions Monitoring Plan. The aeroplane operator shall state in its Emissions Monitoring Plan the points at which block-off measurements will be taken, with a reference to the relevant aeroplane operator documentation, to be approved by the State Authority.</p> <p>Block-on: any time between last engine out and first door open. Any deviation to this definition should be in accordance with the aeroplane operator’s existing operational practices as defined in the Emissions Monitoring Plan. The aeroplane operator shall</p>

	state in its Emissions Monitoring Plan the points at which block-on measurements will be taken, with a reference to the relevant aeroplane operator documentation, to be approved by the State Authority.
3.51	<p>What are the data requirements for the Fuel Use Monitoring Method “Fuel Allocation with Block Hour”?</p> <p><i>Reference in Annex 16, Volume IV: Appendix 2, 2.6.</i></p> <p>Fuel Use Monitoring Method “Fuel Allocation with Block Hour” requires data from all flights of each aeroplane type for the reporting year. This method requires data on block hour of the flight under consideration (BH) and data from other flights of the same aircraft type (ICAO aircraft type designator level) in the same year.</p> <p>There are two ways to implement the method:</p> <ol style="list-style-type: none"> (1) When the aeroplane operator can clearly distinguish between fuel uplifts for domestic and international flights, it uses actual fuel use (determined using the fuel uplift methodology) and block hour per flight for all international flights of the aeroplane type in the reporting year; (2) When the aeroplane operator cannot clearly distinguish between fuel uplifts for domestic and international flights, it uses fuel uplift and block hour of all flights of the aeroplane type in the reporting year. <p>The average fuel burn ratios (AFBR) are computed for each aeroplane operator and aeroplane type used. The computation of average fuel burn ratios is done using the formula in Annex 16, Volume IV, Appendix 2, 2.6.1; the computation of fuel use for individual flights is defined in Annex 16, Volume IV, Appendix 2, 2.6.1 and 2.6.2.</p> <p>An illustrative calculation is provided in the <i>Environmental Technical Manual</i> (Doc 9501), Volume IV – <i>Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSA)</i>, Table 3-7 for the Fuel Allocation with Block Hour Method. The assumed average fuel burn (AFBR) in the illustration is 7 270 tonnes/h.</p>
3.52	<p>How should missing data under the Fuel Use Monitoring Method “Fuel Allocation with Block Hour” be handled?</p> <p><i>Reference in Annex 16, Volume IV: Part II, 2.5.1; Appendix 2, 2.6.</i></p> <p>The fuel allocation with block hour method requires the collection of block time and fuel uplift data to calculate the average fuel burn ratio in a given year for a given aeroplane type.</p> <p>In the case where no primary and secondary data sources are available to determine the block time and/or fuel uplift for one or more flights (i.e. there are data gaps), the aeroplane operator will use the ICAO CORSIA CERT to estimate and report CO₂ emissions for each flight with data gaps.</p> <p>For all remaining flights (i.e., excluding flights with data gaps), the aeroplane operator will apply the fuel allocation with block hour for the respective aeroplane(s) in accordance with Annex 16, Volume IV, Appendix 2, section 2.6. The average fuel burn ratio should be computed without consideration of the flights for which a data gap occurred. The average fuel burn ratio is not to be applied on flights with data gaps.</p>

3.53	What will happen if an aeroplane operator exceeds the eligibility threshold to use ICAO CORSIA CERT during a given year?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.1.3.</i></p> <p>If the emissions of an aeroplane operator increases above the 500 000 tonnes threshold during the 2019 – 2020 period, the State may authorize it to continue using the ICAO CORSIA CERT. From 2021 onwards, if an operator’s annual CO₂ emissions from international flights increases above the 50 000 tonnes threshold in a given year (y) and stays above the threshold in the following year (y+1), the operator will have to submit a revised Emissions Monitoring Plan by 30 September of the subsequent year (y + 2) and start monitoring actual fuel use thereafter (from 1 January of year y+3).</p>
3.54	How is fuel use treated while performing non-commercial activities (e.g., APU fuel use during maintenance)?
	<p><i>Reference in Annex 16, Volume IV: Appendix 2.</i></p> <p>Sometimes an aeroplane does not perform a flight previous or subsequent to the flight for which fuel consumption is being monitored; this could happen, e.g., if the flight under consideration follows a major revision or maintenance. As a result of this, some of the fuel measurement points needed for the application of a certain Fuel Use Monitoring Method might not be available.</p> <p>In such cases the aeroplane operator may substitute the missing fuel measurement point with an alternative fuel measurement point for the flight under consideration, e.g., as recorded in the technical logs.</p>
3.55	How are CO ₂ emissions calculated from the fuel used?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.3.</i></p> <p>After an aeroplane has monitored its fuel use, the operator is required to determine the CO₂ emissions by using the following equation:</p> $\boxed{CO_2 \text{ Emissions} = \text{Mass of fuel} \times \text{Fuel Conversion Factor of given fuel type}}$ <p>Fuel conversion factors are:</p> <ul style="list-style-type: none"> • 3.16 kg CO₂/kg of fuel for Jet-A and Jet-A1 fuel; and • 3.10 kg CO₂/kg fuel for AvGas or Jet-B fuel. <p>After conducting analysis on the matter, these fuel conversion factors were agreed by the CAEP as the appropriate factor to be used at a global level. The analysis took into consideration the work of the IPCC, information from petroleum quality surveys, information from national GHG inventories, other emissions trading schemes, worldwide and regional values for the CO₂ fuel conversion factor, as well as methods that are based on measuring hydrogen and sulphur contents to calculate carbon content.</p> <p>If an aeroplane operator is using the ICAO CORSIA CERT for CO₂ emissions monitoring, the tool automatically estimates the CO₂ emissions, and no separate calculation of emissions is needed.</p>
3.56	Why do we need to know total CO ₂ emissions from international aviation?
	<p>Knowing the total emissions from international aviation is important for several reasons:</p> <ol style="list-style-type: none"> 1) To assess the overall emissions coverage of CORSIA and track progress in achieving the global aspirational goal of carbon neutral growth from 2020.

	<p>2) As States voluntarily participate in CORSIA and the route-based approach affects the emissions coverage of CORSIA, the baseline of average 2019 – 2020 emissions will change to reflect the route-based coverage by CORSIA (also refer to question 2.17 on the calculation of CORSIA baseline).</p> <p>3) The total emissions from international aviation in 2020 is also a reference value that will be used to inform exemptions for new entrants whose annual emissions do not exceed 0.1% of the total 2020 emissions.</p>
3.57	<p>What are the requirements for fuel density?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.3.</i></p> <p>If fuel quantities are measured in units of volume instead of units of mass, then an aeroplane operator is required to convert the fuel volume into fuel mass by applying a fuel density value that is used for operational and safety reasons. For CORSIA purposes, the operator shall either use an actual density value, or a standard density value (0.8 kg/litre). The operator shall detail the procedure for using actual or standard density in its Emissions Monitoring Plan.</p>
3.58	<p>What is the standard fuel density?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.3.</i></p> <p>A standard density value of 0.8 kg per litre is being used under CORSIA.</p>
3.59	<p>How to account for the use of CORSIA Eligible Fuels in the CORSIA MRV system?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.2.4.</i></p> <p>Claims of emissions reductions from the use of CORSIA Eligible Fuels by an aeroplane operator are based on mass of CORSIA Eligible Fuels according to purchasing and blending records.</p> <p>For the purposes of the CORSIA MRV system, an aeroplane operator, that intends to claim for emissions reductions from the use of CORSIA Eligible Fuels, shall use a CORSIA Eligible Fuel that meets the CORSIA Sustainability Criteria. Also, only CORSIA Eligible Fuels from fuel producers that are certified by an approved Sustainability Certification Scheme are allowed under CORSIA. Such certification schemes need to meet specific requirements that are under development by ICAO.</p> <p>The emissions reductions from the use of a CORSIA Eligible Fuel are calculated in the context of reducing the operator’s CO₂ offsetting requirements (see also question 2.19). These calculations use the approved life cycle emissions values for the CORSIA Eligible Fuels.</p> <p>All the relevant documentation on CORSIA Eligible Fuels will be available on the ICAO CORSIA website, once finalized (also see questions 4.11 to 4.19).</p>
	<p>Reporting</p>
3.60	<p>What is the timeline for reporting of CO₂ emissions, and who will report to whom?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.3. and Appendix 1.</i></p> <p>An aeroplane operator is required to submit to the State a verified Emissions Report on an annual basis. The Emissions Report will include information on the previous calendar year’s CO₂ emissions, and it shall be accompanied by a Verification Report that will be developed by a third-party verifier. The operator and the verification body shall both independently submit the verified Emissions Report and associated</p>

	<p>Verification Report to the State Authority (see also question 3.81 for more information on verification).</p> <p>For example, CO₂ emissions from the calendar year of 2019 shall be reported to the State by 31 May 2020. CO₂ emissions from the calendar year of 2020 shall be reported by 31 May 2021. Regarding the CO₂ emissions for the period of 2021-2035, the reporting deadline of the previous calendar year's CO₂ emissions is 30 April.</p> <p>After the State has received the Emissions Reports from all attributed aeroplane operators, the State shall submit required information regarding the CO₂ emissions to ICAO. This will take place by 31 August 2020 for 2019 emissions. For 2020 emissions, the State shall submit this information by 31 August 2021. Regarding CO₂ emissions from 2021-2035, the annual reporting deadline from States to ICAO is 31 July following the calendar year for which the CO₂ emissions are being reported.</p>
3.61	<p>Do all international routes have to be included in the Emissions Report, or only the international routes with the States that participate in the CORSIA offsetting?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Appendix 5.</i></p> <p>All international routes need to be included for reporting. Appendix 5 of Annex 16, Volume IV includes the content of an Emissions Report from aeroplane operator to State. From 2021, information to be reported includes the total CO₂ emissions from flights subject to offsetting requirements, and the total CO₂ emissions from international flights, that are not subject to offsetting requirements.</p>
3.62	<p>Who decides on the selection of aggregation level for the CO₂ emissions data (State pair or aerodrome pair)?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.3.1.</i></p> <p>According to the Annex 16, Volume IV, the State shall decide on the level of aggregation (i.e., State pair or aerodrome pair) for which an aeroplane operator attributed to it shall report the number of international flights and CO₂ emissions. The State shall inform the operator whether the operator's annual Emissions Report shall include State pair or aerodrome pair level information during the approval process of the Emissions Monitoring Plan.</p>

3.63	What is the level of aggregation of the CO ₂ emissions information that will be reported to States, and to ICAO?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.3. and Appendix 5.</i></p> <p>The State shall decide on the level of aggregation (i.e., State pair or aerodrome pair) for which an aeroplane operator is required to report the number of international flights and CO₂ emissions (also see question 3.62).</p> <p>The annual Emissions Report from an aeroplane operator to the State includes CO₂ emissions from all international flights per aerodrome pair or State pair (as per State’s decision), no matter whether these flights are subject to CORSIA offsetting requirements or not.</p> <p>A “State pair” in this context means a group of two States composed of a departing State or its territories and an arrival State or its territories (e.g., flights between two States, State A and State B, will be reported as separate State pairs: A-B, and B-A).</p> <p>In turn, the information to be reported from State to ICAO includes:</p> <ul style="list-style-type: none"> • Total annual CO₂ emissions for each State pair aggregated for all aeroplane operators from 2019; • Total annual CO₂ emissions for each aeroplane operator from 2021; • Total aggregated annual CO₂ emissions for all State pairs subject to offsetting requirements for each aeroplane operator from 2021; and • Total aggregated annual CO₂ emissions for all State pairs not subject to offsetting requirements for each aeroplane operator from 2021. <p>Complete information to be reported from aeroplane operators to States, and from States to ICAO is included in Annex 16, Volume IV Appendix 5.</p>
3.64	What is the ICAO tool to facilitate reporting of the necessary information from States to ICAO?
	The CORSIA Central Registry (CCR), being developed by ICAO, provides a tool for States to submit data and information to ICAO.
3.65	Where can one find more information about the CORSIA Central Registry CCR?
	Please refer to section 4 of these FAQs for more information about the CCR.
3.66	Are there any provisions regarding the confidentiality of data if a route is only operated by one operator?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.3.</i></p> <p>When an aeroplane operator operates a very limited number of State pairs that are subject to offsetting requirements, and/or a very limited number of State pairs that are not subject to offsetting requirements, it may request to the State that such data not be published at the aeroplane operator level. The same applies when aggregated State pair data may be attributed to an identified aeroplane operator as a result of a very limited number of aeroplane operators conducting flights between that State pair. Based on the request, the State shall determine whether this data is confidential.</p> <p>All data recognized as confidential by States will be aggregated and published by ICAO without attribution to a specific aeroplane operator, or to a specific State pair. There will be distinction between State pairs subject to offsetting requirements, and those not subject to offsetting requirements (see also question 4.41).</p>

3.67	Are the reporting periods and compliance periods the same for all operators?
	<p><i>Reference in Annex 16, Volume IV: Appendix 1.</i></p> <p>Yes. All aeroplane operators are subject to the same reporting and compliance periods. Reporting periods are annual and correspond to calendar years. Compliance periods for offsetting requirements are 3-year periods, with the first period starting on 1 January 2021 and ending on 31 December 2023.</p>
3.68	Is there an established template for reporting annual CO ₂ emissions from an aeroplane operator to the State, and from the State to ICAO?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.3.</i></p> <p>It is recommended that an aeroplane operator uses the standardised Emissions Report template provided in the <i>Environmental Technical Manual</i> (Doc 9501), Volume IV – <i>Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSA)</i>. The template is also available on the ICAO CORSA webpage.</p> <p>Regarding the reporting from a State to ICAO, the CCR will provide a standardized format and means to submit the CORSA specific data from a State to ICAO, and also allow ICAO to consolidate and develop the necessary reports for CORSA.</p>
3.69	What if there are gaps identified in the reported data?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.5.1.</i></p> <p>Data gaps may occur as a result of an aeroplane operator missing data that are needed for the determination of its fuel use on one or more international flights. In a case of a data gap, an aeroplane operator is required to correct issues identified with the data and information management system in a timely manner to mitigate ongoing data gaps and system weaknesses.</p> <p>As a part of its Emissions Monitoring Plan, an aeroplane operator has to identify secondary data sources to prevent data gaps. For example, if an aeroplane operator normally uses ACARS data and, due to a problem, is missing this data for a flight, it may still be able to source actual fuel data from fuel invoices or technical logs as the secondary sources.</p>
3.70	What constitutes a data gap? How can such data gaps be addressed?
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.5.</i></p> <p>Data gaps occur when an aeroplane operator is missing data relevant for the determination of its fuel use for one or more international flights. Gaps in emissions-related data can occur due to various reasons, including irregular operations, data feed issues or system failures. For example, a missing Block-off value, a missing fuel invoice, or a missing fuel density measurement, and no secondary source is available. It may, on occasion, include information about the actual flight itself, such as aerodrome of departure or aerodrome of destination incorrectly recorded, or unavailable from, on board system.</p> <p>When data from a primary source is missing but an agreed secondary source can be used instead, as detailed and approved in the aeroplane operator's Emissions Monitoring Plan, this is sufficient to provide the information and it is not considered a data gap. The primary data source refers to the electronic or paper process and documentation which are used by default by the operator to record fuel data measurements. A secondary data source is any other process and documentation which</p>

	<p>can be used by the operator to record fuel data measurements required for the application of the approved fuel monitoring method. The secondary data source must provide a fuel data measurement and cannot be estimated or statistically reconstructed. The measurement must be equivalent to the measurement which would have been obtained through the primary source, and it should not be measured at a materially different point in time. Such secondary sources may include, for example, the technical log or a fuel invoice.</p> <p>Using a data source from an equivalent point in time as the missing measurement allows the approved monitoring method to be completed so as to achieve the measurement of fuel for the flight in question according to the requirements of that monitoring method. To use a simple example, the secondary data source for block-off / block-on provides a recorded measurement of block-off fuel at an equivalent time to when the regular block-off measurement would be taken and/or it provides a recorded measurement of block-on fuel at an equivalent time to when the regular block-on measurement would be taken. If such a data source is not available, it is not permitted, for example, to use the fuel uplift method instead for that flight but the CO₂ emissions for the flight in question should be estimated with the ICAO CORSIA CERT.</p> <p>A data gap occurs when approved primary and secondary data are not available (i.e., the data is incomplete to calculate the emissions for the flight) and, as a result, the approved Fuel Use Monitoring Method cannot be applied to determine fuel use. In this case, the emissions for the flight in questions will be estimated using the ICAO CORSIA CERT.</p>
3.71	<p>What is the threshold for using ICAO CORSIA CERT to fill data gaps?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.5.1.</i></p> <p>If the data gap does not exceed 5 per cent of international flights for the 2019-2020 period, or 5 per cent of international flights subject to offsetting requirements for the 2021-2035 period, an aeroplane operator using a Fuel Use Monitoring Method is required to fill data gaps by using the ICAO CORSIA CERT.</p> <p>If there are data gaps that exceed a 5 per cent threshold of total international flights, the operator is responsible for stating the percentage of data gaps, and for engaging with the State in order to address the issue.</p>
3.72	<p>Is the 5 per cent data gap threshold based on CO₂ emissions or number of flights?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.5.1.</i></p> <p>The 5 per cent threshold refers to the number of international flights (and not to the amount of CO₂ emissions). Please also refer to question 3.71 for precise definitions of the data gap thresholds.</p>
3.73	<p>Is an alternative estimation approach (instead of using the ICAO CORSIA CERT) possible for addressing data gaps?</p> <p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.5.1.</i></p> <p>If an aeroplane operator has data gaps and system weaknesses that exceed the 5 per cent threshold, the operator shall engage with the State to address the issue. The operator shall also state the percentage of international flights that had data gaps, and provide an explanation to the State in the Emissions Report.</p> <p>The operator is required to fill all data gaps and correct systematic errors and misstatements prior to the submission of the Emissions Report. Alternative data</p>

	<p>sources, such as air traffic control (ATC) records, flight logs, flight plans, etc., are also possible for addressing data gaps and for estimating CO₂ emissions in such cases, however, Annex 16, Volume IV is clear in that an aeroplane operator using a Fuel Use Monitoring Method, shall fill data gaps using the ICAO CORSIA CERT, provided that the data gaps during a compliance period do not exceed the data gap thresholds (see also question 3.71).</p>
3.74	<p>Will CORSIA's baseline emissions be affected due to an error correction to the Emissions Report?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.6.</i></p> <p>No, there will not be adjustments made to the total sectoral CO₂ emissions or the Sector's Growth Factor as a result of error correction to Emissions Report.</p>
3.75	<p>What happens in case of no reporting by an aeroplane operator or a State?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.5.2.</i></p> <p>If an aeroplane operator does not provide its annual Emissions Report in accordance with the reporting timeline, the State is required to take action and to engage with the aeroplane operator to clarify the situation. If this proves unsuccessful, then the State shall estimate the aeroplane operator's annual emissions using the best available information and tools, such as the ICAO CORSIA CERT.</p> <p>In a case where the State does not provide its annual Emissions Report to ICAO in accordance with the reporting timeline, then the data provided by ICAO shall be used to fill the missing information and to make relevant calculations.</p> <p>The State is required to take necessary action to ensure that the necessary national policies and regulatory framework be established for the compliance and enforcement of CORSIA (see also question 3.10).</p>
3.76	<p>Who reports emissions from an aeroplane operator that has gone bankrupt during a reporting year?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.5.2.</i></p> <p>If an aeroplane operator's CO₂ emissions exceed 10 000 tonnes CO₂ for the year when the bankruptcy takes place, the operator falls within the applicability of CORSIA MRV requirements, and is required to submit an Emissions Report to the State Authority. If the operator fails to submit an Emissions Report in such a situation, and the State is not able to obtain necessary information from the operator, then the State shall estimate the operator's annual emissions by using the best available information and tools, such as the ICAO CORSIA CERT.</p>
3.77	<p>Why does a State need to provide State pair data to ICAO, even if this data has been identified as confidential?</p>
	<p><i>Reference in Annex 16, Volume IV: Appendix 5.</i></p> <p>State-pair level data will define the baseline emissions for each State pair as the average of 2019 and 2020 emissions, which will be compared against the annual emissions from 2021 onwards from those State pairs that are subject to offsetting requirements, in order for ICAO to calculate the Sector's Growth Factor (see question 2.15).</p> <p>Any disaggregated data that has been determined as confidential by the State and informed to ICAO accordingly, will not be disclosed to the public by ICAO (also see question 3.66).</p>

3.78	<p data-bbox="304 150 1460 188">How does an aeroplane operator report the use of CORSIA Eligible Fuels?</p> <p data-bbox="304 188 1460 226"><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.3 and Appendix 5.</i></p> <p data-bbox="304 226 1460 629">An aeroplane operator shall report the use of CORSIA Eligible Fuels as a part of its annual Emissions Report. In addition, in order to claim emissions reductions from the use of such fuels, the operator will provide supplementary information to the Emissions Report, which includes the details of the CORSIA Eligible Fuels and associated emissions reductions. A template of a CORSIA Eligible Fuels supplementary information to the Emissions Report is provided in the <i>Environmental Technical Manual (Doc 9501), Volume IV – Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)</i>, and is also available on the ICAO CORSIA website.</p> <p data-bbox="304 629 1460 703">All the relevant documentation on CORSIA Eligible Fuels will be available on the ICAO CORSIA website, once finalized (also see questions 4.11 to 4.19).</p>
3.79	<p data-bbox="304 703 1460 779">Why should an aeroplane operator report CORSIA Eligible Fuels every year while the compliance cycle is three years?</p> <p data-bbox="304 779 1460 817"><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.3.3.</i></p> <p data-bbox="304 817 1460 965">Annex 16, Volume IV includes a recommendation for an aeroplane operator to make CORSIA Eligible Fuel claims on an annual basis, in order to ensure all documentation is dealt with in a timely manner.</p> <p data-bbox="304 965 1460 1111">However, the aeroplane operator also has the option to make a CORSIA Eligible Fuel claim by the end of a given compliance period for all CORSIA Eligible Fuel received by a blender within that compliance period (also see question 2.19).</p>
3.80	<p data-bbox="304 1111 1460 1149">What will be the process of reporting of emissions unit cancellations?</p> <p data-bbox="304 1149 1460 1187"><i>Reference in Annex 16, Volume IV: Part II, Chapter 4, 4.3.</i></p> <p data-bbox="304 1187 1460 1406">An aeroplane operator is required to report to the State the cancellation of CORSIA Eligible Emissions Units to meet its total final offsetting requirements for a given compliance period. The operator will do this by submitting to the State a copy of the verified Emissions Unit Cancellation Report and a copy of the associated Verification Report.</p> <p data-bbox="304 1406 1460 1626">The first deadline for reporting of emissions unit cancellations will be on 30 April 2025. By that time an aeroplane operator and the verification body are required to submit to the State Authority the verified Emissions Unit Cancellation Report and associated Verification Report for the 2021-2023 compliance period (also see question 3.87).</p> <p data-bbox="304 1626 1460 1809">The State shall report to ICAO aggregated information on the cancellations of emissions units by the operators attributed to the State. This report shall contain the information as defined in Annex 16, Volume IV, Appendix 5, Table A5-8 (see also question 4.42).</p> <p data-bbox="304 1809 1460 1921">CAEP work is currently ongoing to produce a template for an Emissions Units Cancellation Report from aeroplane operators to States.</p>
	<p data-bbox="304 1921 1460 1960">Verification</p>
3.81	<p data-bbox="304 1960 1460 2036">How does the verification of CO₂ emissions work in CORSIA? Who will do the verification?</p>
	<p data-bbox="304 2036 1460 2074"><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.4. and Appendix 6.</i></p>

	<p>Verification on emissions data intends to ensure the consistency of information, and to identify any potential errors in the aeroplane operator’s annual Emissions Report. CORSIA foresees a three-step verification pathway:</p> <ul style="list-style-type: none"> • At Step 1, a voluntary internal pre-verification by an aeroplane operator is recommended. This means that the aeroplane operator conducts a verification of its data before submitting it to a third-party verification body. The internal pre-verification is likely to increase the quality of the Emissions Report, but it does not replace the requirement for third-party verification. • At Step 2, a third-party verification is performed by an independent third-party verification body, before the operator reports to the State Authority. The requirements for the third-party verification will be based on existing Standards from the International Organization for Standardization (ISO), as well as on CORSIA-specific requirements from Annex 16, Volume IV. A third-party verification body is contracted by an aeroplane operator. • At Step 3, the State Authority conducts an order of magnitude review. This is the check performed by a State to verify the data against different sources of information that the State has access to.
3.82	<p>Is it necessary for an aeroplane operator to perform an internal pre-verification of its Emissions Report, prior to the third-party verification?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 4, 2.4.1.2.</i></p> <p>Voluntary pre-verification is a recommended practice for an aeroplane operator. Pre-verification will provide the operator with an opportunity to identify potential irregularities and take corrective actions prior to third-party verification, thereby having a potential to save time and resources later on in the process.</p> <p>The <i>Environmental Technical Manual</i> (Doc 9501), Volume IV – <i>Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)</i> provides a recommended checklist approach for the internal pre-verification.</p>
3.83	<p>Does the voluntary pre-verification by an aeroplane operator substitute the third-party verification?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 4, 2.4.1.2.</i></p> <p>No. The voluntary pre-verification does not substitute the third-party verification. Voluntary pre-verification is not a requirement, although aeroplane operators are recommended to conduct a pre-verification as a preparatory activity for the third-party verification process.</p>
3.84	<p>Is a third-party verification needed when an aeroplane operator uses the ICAO CORSIA CERT?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 4, 2.4.1.</i></p> <p>Yes, an aeroplane operator shall engage a third-party verification body for the verification of its annual Emissions Report also when the ICAO CORSIA CERT has been used for generating an Emissions Report.</p>
3.85	<p>What are the requirements to be accredited as a verification body to conduct the third-party verification?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.4. and Appendix 6.</i></p> <p>In order to be eligible to verify the Emissions Report of the aeroplane operator under CORSIA, a verification body must be accredited to ISO Standard 14065:2013</p>

	<p><i>(Greenhouse gases – Requirements for greenhouse gas validation and verification bodies for use in accreditation or other forms of recognition)</i>, and to the relevant requirements described in Annex 16, Volume IV, Appendix 6.</p> <p>Once accredited, the verification body is required to conduct the verification according to ISO Standard 14064-3:2006 (Greenhouse gases – Part 3: Specification with guidance for the validation and verification of greenhouse gas assertions), and to the relevant requirements in Annex 16, Volume IV, Appendix 6.</p>
3.86	<p>Are the references to ISO Standards included in Annex 16, Volume IV to specific versions, or will the latest version of ISO standard be automatically apply?</p>
	<p>The ISO Standards referred to in Annex 16, Volume IV are:</p> <ul style="list-style-type: none"> • ISO Standard 14064-3:2006 (Greenhouse gases – Part 3: Specification with guidance for the validation and verification of greenhouse gas assertions) • ISO Standard 14065:2013 (Greenhouse gases – Requirements for greenhouse gas validation and verification bodies for use in accreditation or other forms of recognition) • ISO/IEC 17011:2004 (Conformity assessment – General requirements for accreditation bodies accrediting conformity assessment bodies) <p>Reference is always made to a specific version of an ISO Standard. Should there be changes or revisions to the respective ISO Standard, these changes will be analysed during the process of maintaining Annex 16, Volume IV, and the references to the ISO Standards in the Annex 16, Volume IV will be updated accordingly, if deemed appropriate.</p>
3.87	<p>What are the requirements for the verification of an Emissions Unit Cancellation Report?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 4, 4.4.</i></p> <p>Verification of an Emissions Unit Cancellation Report follows very similar process and requirements as the verification of an annual Emissions Report. In order to be eligible to verify the Emissions Unit Cancellation Report of the aeroplane operator under CORSIA, a verification body must be accredited to ISO Standard 14065:2013 (Greenhouse gases – Requirements for greenhouse gas validation and verification bodies for use in accreditation or other forms of recognition), and to the relevant requirements described in Annex 16, Volume IV, Appendix 6. Accreditations are granted by national accreditation bodies. National accreditation bodies are required to work in accordance with ISO/IEC 17011 (Conformity assessment – General requirements for accreditation bodies accrediting conformity assessment bodies).</p> <p>Once accredited, the verification body is required to conduct the verification according to ISO Standard 14064-3:2006 (Greenhouse gases – Part 3: Specification with guidance for the validation and verification of greenhouse gas assertions), and in accordance with the relevant requirements in Annex 16, Volume IV, Appendix 6.</p> <p>It should be noted that an aeroplane operator may choose to use the same verification body for the verification of an Emissions Units Cancellation Report as it has engaged for the verification of the Emissions Report, although the operator is not obligated to do so.</p> <p><i>Note - Please note that CAEP experts are working to provide the necessary guidance on the verification of the Emissions Units Cancellation Report to be included in a future revision of the Environmental Technical Manual (Doc 9501), Volume IV –</i></p>

	Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSA).
3.88	How much time is normally required for the third-party verification process?
	The time required for the verification process will vary on a case by case basis. The time required relates to, e.g., the size of the operator and whether simplified procedures, such as the ICAO CORSA CERT, have been used.
3.89	Who pays for the third-party verification and what will be the price? Is a price list included in the list of verification bodies to be compiled by ICAO?
	An aeroplane operator will be responsible for covering the cost of the third-party verification of its Emissions Reports and Emissions Unit Cancellation Reports. Details of the verification (including the price of the verification service) will be agreed and included in the contract between an aeroplane operator and a verification body.
3.90	Who accredits the verification body?
	<i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.4</i> Accreditations are granted by national accreditation bodies. National accreditation bodies are required to work in accordance with ISO/IEC 17011 (Conformity assessment – General requirements for accreditation bodies accrediting conformity assessment bodies).
3.91	Can an aeroplane operator become a verification body?
	<i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.4. and Appendix 6.</i> No. The verification body is required to be accredited to ISO 14065, but not the aeroplane operator. The verification body must be independent from the aeroplane operator, so even if an operator were to be certified to ISO 14065, it could not undertake the verification of its own Emissions Report.
3.92	How can an aeroplane operator identify an accredited verification body?
	<i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.3.7.</i> The State is required to submit to ICAO a list of nationally-accredited verification bodies. ICAO will compile this information, and make available a list of verification bodies accredited in each State as a part of the ICAO document entitled “CORSA Central Registry (CCR): Information and Data for Transparency”, in order to facilitate the identification of an accredited verification body by an aeroplane operator. The first edition of this ICAO document has been approved by the ICAO Council and is available for download on the ICAO CORSA webpage . An aeroplane operator may consult this list in order to identify and contract a verification body for the verification of the Emissions Report.
3.93	Does the verification body have to be from the administrating State of an aeroplane operator?
	<i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.4.2.</i> An aeroplane operator may engage a verification body accredited in another State, as long as the State in which the aeroplane operator has been attributed to recognises this accreditation.
3.94	What if there is no accredited verification body in a State?
	<i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.4.</i> An aeroplane operator may engage a verification body accredited in another State, subject to rules and regulations affecting the provision of verification services in the

	State to which the aeroplane operator is attributed.
3.95	What can a State do if it has limited accreditation structure in place to support the verification process?
	<p><i>Reference in Annex 16, Volume IV: Appendix 6</i></p> <p>If a State has not (yet) installed a national accreditation body (NAB) (or a similar institution which operates in accordance with ISO 17011) or has made a deliberate decision to not implement an ISO 14065 accreditation scope through its NAB, the following alternative options can be assessed by the State:</p> <p>(1) A State may include in its national CORSIA regulation a provision to accept verification statements of verification bodies accredited by a specific foreign regional NAB (by naming the specific NAB). To gain guidance and an overview of the accreditation situation of other States in the geographical region, contact with the regional accreditation cooperation bodies is recommended (please see below).</p> <ul style="list-style-type: none"> • For Africa SADCA (Southern African Development Community in Accreditation); • For Africa AFRAC (African Accreditation Cooperation); • For Asia-Pacific PAC (Pacific Accreditation Cooperation); • For America IAAC (Inter American Accreditation Cooperation); • For Arabian Peninsula ARAC (Arab Accreditation Cooperation); • For Europe EA (European Accreditation). <p>However, it is strongly advised to analyse the specific accreditation scope of a NAB before the verification statements of accredited verification bodies could be accepted as it is important to ensure that the accreditation is indeed based on the requirements of Annex 16, Volume IV and the corresponding <i>Environmental Technical Manual (Doc 9501), Volume IV – Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)</i>. This is important as States have the freedom to adapt the accreditation scope to their specific national requirements (e.g. technical provisions on data submission).</p> <p>(2) Alternatively, a State could directly refer in its national legislation to the ICAO CORSIA Implementation Elements as ICAO publishes a list of verification bodies accredited in each State. This, however, is not the preferred approach as a direct link to the ICAO CORSIA Implementation Elements would lead to an automatic acceptance of all published verification bodies, including those accredited by foreign NABs solely to Annex 16, Volume IV and the corresponding <i>Environmental Technical Manual (Doc 9501), Volume IV – Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)</i>, and those accredited by NABs that included deviating provisions in the accreditation scope (specific national requirements). Similar with (1), the State is strongly advised to analyse the specific accreditation scope of a NAB before accepting the verification statements of accredited verification bodies.</p> <p>(3) In addition to a national CORSIA accreditation scope, some NABs may also offer verification bodies an (additional) accreditation on the basis of an internationally applicable CORSIA scope (unbiased by any regional legal characteristics, solely based on Annex 16, Volume IV and the corresponding <i>Environmental Technical</i></p>

	<p><i>Manual (Doc 9501), Volume IV – Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSA).</i> Such a ‘clean’ accreditation scope can be recommended to be used for verifications in States with a limited accreditation infrastructure. Similar as with option 1, contact to the regional accreditation cooperation bodies is recommended to identify any NABs in the geographical region which offer such an international CORSA accreditation scope. Moreover, most NABs would also accept to accredit foreign verification bodies. Consequently, a NAB offering an international CORSA scope could potentially also accredit an organization which is based in a State which itself has only a limited accreditation infrastructure.</p>
3.96	<p>Must a State ensure to have accredited verification bodies through its national accreditation body by 30 April 2019?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 1, 1.3.7; and Appendix 1,</i></p> <p>No. States are asked to submit a list of verification bodies accredited in the State to ICAO, if any, at least once a year. The first time this is requested is by 30 April 2019. In addition, a State may submit updates to this list on a more frequent basis. As the accreditation process takes time, it might not be the case that all States can submit extensive lists of accredited verification bodies before 30 April 2019. However, as the number of verification bodies is expected to increase over time, States may submit updates to the list on a more frequent basis as needed.</p>
3.97	<p>What may a witness audit involve during the accreditation process of a verification body?</p>
	<p><i>Reference in Annex 16, Volume IV: Appendix 6, 2.12.</i></p> <p>The accreditation process of a verification body normally involves a witness audit where the NAB monitors the verification approach taken by the witnessed verification body during an actual audit. For a new scheme such as CORSA it can prove challenging for a NAB not just to schedule witness audits during the (short) verification period (e.g. 1 January till 31 May 2020) but to also finish the remaining administrative accreditation process within this period to enable the verification body to present a valid verification statement of an accredited verification body to its customer.</p> <p>Obviously this approach includes risks for the aeroplane operator as well. At the beginning of the scheme, aeroplane operators would need to select a not yet accredited verification body and somehow assess whether the verification body will indeed pass the accreditation process. There is always a remaining risk that the verification body would fail and therefore the aeroplane operator (within the remaining time) would not be able to source verification services from another verification body in time.</p> <p>To address the issue, the verification body may demonstrate its abilities by pre-auditing data of the aeroplane operator in 2019 already, subject to the agreement of the aeroplane operator. The aeroplane operator would prepare the emissions data and Emissions Report with data from the first month of 2019 and the verification body would perform the witnessed audit on the basis of this (limited) report. This is also a good opportunity for the aeroplane operator to identify issues within the data gathering process at a very early stage which still leaves sufficient time to also resolve methodical errors.</p> <p>Assuming that the witness audit (within the pre-audit) would take place between June and August 2019, the remaining time is enough for the NAB to finish the</p>

	<p>administrative part of the accreditation process. Consequently, with the beginning of 2020 aeroplane operators would have clear knowledge which verification bodies have successfully qualified for the CORSIA accreditation scope. An aeroplane operator could then either continue with its verification body (beyond the pre-audit engagement) or source a verification body which has successfully passed the accreditation process.</p>
3.98	<p>How does a verification team meet the knowledge requirements?</p>
	<p><i>Reference in Annex 16, Volume IV: Appendix 6, 2.5.</i></p> <p><i>Note: The information contained in the answer to this question is of primary interest to verification bodies.</i></p> <p>With the exception of any relevant national additional provisions required by Annex 16, Volume IV, Appendix 6, 2.5.1 e) or relevant national stipulations^(*), the knowledge requirements listed in Annex 16, Volume IV, Appendix 6, section 2.5 can be fully met by an in-depth study of Annex 16, Volume IV and the corresponding <i>Environmental Technical Manual (Doc 9501), Volume IV – Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)</i>.</p> <p>Since knowledge of these requirements is of utmost importance, other means may be important additions for the overall education of verification teams. The following list of options can facilitate the development of training approaches to ensure knowledgeable verification teams.</p> <p>Internal training: this type of training refers to an individual or group study within the verification body. Internal courses are prepared by internal trainers or verifiers based on Annex 16, Volume IV, Appendix 6, the <i>Environmental Technical Manual (Doc 9501), Volume IV – Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)</i>, and other potentially relevant or supporting information, e.g. ICAO website. It is essential to document the courses, including documenting the content of the training, training material, time and duration of meetings and lists of attendees. It is recommended to conclude these training courses with a written knowledge test and a minimum pass rate.</p> <p>Contracting an external trainer (customized training): verification bodies can contract with an external trainer to receive training for their teams. This does not replace an internal process within the verification body to ensure that the full content of Annex 16, Volume IV and the <i>Environmental Technical Manual (Doc 9501), Volume IV – Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)</i> was included in the training and that the training was documented. This approach can reduce overall demands on the verification body but the availability of external trainers might be limited, especially at the beginning of the scheme.</p> <p>Attendance on external training course or participation in external information session: the verification body can place team members on an external training course or have them participate in external information sessions (e.g. ICAO or State organized events). The verification body would retain responsibility for ensuring that the full content of Annex 16, Volume IV and the <i>Environmental Technical Manual (Doc 9501), Volume IV – Procedures for demonstrating compliance with the Carbon</i></p>

	<p><i>Offsetting and Reduction Scheme for International Aviation (CORSA)</i> was included in the training, and that the training was documented and completed to a satisfactory standard e.g. with an exam and minimum pass rate at the end. However, it is recognised that there may be limited availability of such courses at the beginning of the scheme.</p> <p>Combination of options outlined above: in order to reach a sufficient understanding of the CORSA provisions (including the specific national legislation), verification bodies might use different sources of information, such as an internal training approach with self-study based on available ICAO information, followed by a one-day customised internal training to address any open or remaining questions. Finally, any information sessions provided by States should be attended so that team members can inform themselves about the relevant national legislation and CORSA characteristics.</p> <p>^(*) e.g. <i>Decision by the State to require aeroplane operators to submit data on a State pair or aerodrome pair level (Emissions Report)</i>. It is important to point out that the verification body would also need to demonstrate knowledge of any additional relevant national requirements, or procedures for determining national requirements related to flexibilities within Annex 16, Volume IV.</p>
3.99	<p>How does a verification team meet the technical expertise requirements?</p>
	<p><i>Reference in Annex 16, Volume IV: Appendix 6, 2.6.</i></p> <p><i>Note: The information contained in the answer to this question is of primary interest to verification bodies.</i></p> <p>The technical expertise requirements listed in Annex 16, Volume IV, Appendix 6, 2.6 refer in most cases to expertise which cannot be obtained by an intensive study of Annex 16, Volume IV and the corresponding <i>Environmental Technical Manual (Doc 9501)</i>, Volume IV – <i>Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSA)</i>. However, the listed items form the minimum technical understanding which is necessary for a verification team to conduct a verification.</p> <p>During the accreditation, the verification body must demonstrate that it has processes in place to ensure the appointment of technically competent verification teams. One example of such a process involves conducting a detailed comparison of the requirements outlined in Annex 16, Volume IV, Appendix 6, 2.6.1 and 2.6.2 in the form of a matrix, specifying for each verification team member to what extent each of the requirements listed are being met (gap analysis) and which documents were used to prove a specific expertise.</p> <p>After analysing the verification team technical expertise, it is the task of the verification body to analyse whether the identified distribution of competencies throughout the potential verifiers could be combined into a team that meets all the requirements in Annex 16, Volume IV, Appendix 6, 2.6. Depending on the results of this review, several options are possible.</p> <p>If the result of the review is that the verification body already has a team of verifiers that satisfy each of the competencies listed in Annex 16, Volume IV, Appendix 6, 2.6.1 and 2.6.2, including members who have sufficient expertise to fulfil the role of the independent reviewer, the verification body can use its existing verifiers to conduct the CORSA verification.</p> <p>If the result of the review indicates there is a gap in technical competency, the</p>

	<p>verification body needs to develop and document a training approach to resolve the deficits in accordance with its established internal processes. These are similar to the approaches described above in the guidance for Annex 16, Volume IV, Appendix 6, 2.5, such as internal or external training, as well as the applied training options described in the corresponding section of the <i>Environmental Technical Manual</i> (Doc 9501), Volume IV – <i>Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSA)</i>. However, as Annex 16, Volume IV, Appendix 6, 2.6 has a strong emphasis on both expertise and experience, hiring of additional staff is an alternative, which should be considered by the verification body.</p>
3.100	<p>How does an independent reviewer meet the knowledge and technical expertise requirements?</p>
	<p><i>Reference in Annex 16, Volume IV: Appendix 6, 2.5 and 2.6.</i></p> <p><i>Note: The information contained in the answer to this question is of primary interest to verification bodies.</i></p> <p>Independent reviewers are also required to meet the provisions of Annex 16, Volume IV, Appendix 6, 2.5 and 2.6, given that only comprehensive knowledge and expertise enables the independent reviewer to satisfactorily fulfil its task. This includes the critical analysis of the verification approach taken by the verification team such as reviewing the provided information and data, identifying contradictory information, ensuring completeness and integrity of documentation and potentially questioning the proposed verification statement.</p> <p>The approaches and options to meet the knowledge and expertise requirements outlined for the verification teams in the previous FAQs are applicable for the independent reviewer as well. This also includes the option that an independent review could be performed by two or more people with complementary knowledge and expertise to satisfy all provisions in Annex 16, Volume IV, Appendix 6, 2.5 and 2.6.</p> <p>Annex 16, Volume IV, Appendix 6, 2.9 enables the verification body to establish a partnership to outsource the independent review to a qualified entity. Nevertheless, this option should only be chosen if the verification body itself is not in the position to identify among its own staff people not involved in the verification engagement who meet the knowledge requirements to perform the independent review, and also if this approach is duly covered by its accreditation. In this regard, it is important to establish sufficient means in the internal documentation of the verification body to give the independent reviewer appropriate authority and access to necessary data and information to carry out the review.</p>
3.101	<p>Can the independent review be outsourced to another verification body?</p>
	<p><i>Reference in Annex 16, Volume IV: Appendix 6, 2.9.</i></p> <p>No. Outsourcing within the Annex 16, Volume IV refers to contracted external verifiers who are part of the verification body and therefore covered by the accreditation.</p>
3.102	<p>To avoid conflicts of interest, the leader of the verification team cannot undertake more than six verifications without a three consecutive year break. What if the leader performs three verifications, stops for one year, and then performs another three verifications?</p>
	<p><i>Reference in Annex 16, Volume IV: Appendix 6, 2.2.</i></p>

	The requirement to take a three consecutive year break also applies in cases where the six annual verifications are not consecutive. Therefore, a three consecutive year break will still be required if the leader performs three verifications, stops for one year, and then performs another three verifications.
3.103	What are the contents of a Verification Report?
	<p><i>Reference in Annex 16, Volume IV: Appendix 6, 3.10.</i></p> <p>According to Annex 16, Volume IV, a verification body shall submit a copy of a Verification Report to the aeroplane operator. Upon authorization by the operator, the verification body shall forward a copy of the Verification Report together with the Emissions Report, the Emissions Unit Cancellation Report, or both, to the State.</p> <p>Contents of a Verification Report are outlined in Appendix 6 of Annex 16, Volume IV.</p>
3.104	Is there a template for Verification Report?
	CAEP work is ongoing provide a template for a Verification Report. Once finalized, the template will be made available on ICAO CORSIA webpage .
3.105	What does “materiality” mean in connection to the verification of CO ₂ emissions?
	<p><i>Reference in Annex 16, Volume IV: Appendix 6, 3.4.</i></p> <p>Materiality refers to the concept that individual misstatements and non-conformities, or the aggregation of them, could affect the correct amount of CO₂ emissions stated in the Emissions Report. A specific piece of information is considered to be material if, by its inclusion or exclusion, it can influence the emissions calculation or actions or decisions taken based on it. Materiality is linked to the quality of the Emissions Report and therefore its acceptance.</p> <p>Regarding the accepted level of materiality in CORSIA, Annex 16, Volume IV prescribes the following two materiality levels:</p> <ul style="list-style-type: none"> • For aeroplane operators with annual CO₂ emissions from international flights, above 500 000 tonnes the materiality threshold is 2 per cent. • For aeroplane operators with annual CO₂ emissions from international flights equal or less than 500 000 tonnes the materiality threshold is 5 per cent. <p>These are the largest acceptable percentage discrepancies between the declared amount of emissions in the aeroplane operator’s Emissions Report and the verification body’s estimation of the total amount of emissions.</p> <p>In the context of verification of an Emissions Report under CORSIA, the over and understatements contained in the sample of flights being verified are allowed to balance out each other.</p>
3.106	Does the verification body need to include non-material misstatements and non-conformities as a part of the Verification Report?
	<p><i>Reference in Annex 16, Volume IV: Appendix 6, 3.10.</i></p> <p>Yes. A verification body is required to include non-conformities and misstatements identified during the verification into the Verification Report, including a description of how these have been resolved.</p>
3.107	Is a non-conformity acceptable if it does not lead to a material discrepancy?

	<p><i>Reference in Annex 16, Volume IV: Appendix 6, 3.10.</i></p> <p>Yes. If the Emissions Report includes non-material misstatement and/or non-material non-conformities, the verification body will verify the Emissions Report as ‘verified as satisfactory with comments’, specifying the misstatements and non-conformities. The verification body must exercise professional judgment when evaluating the significance of issues with regards to misstatements, non-conformities and their impact on materiality.</p> <p>Also note that an aeroplane operator is required to fill all data gaps and correct systematic errors and misstatements prior to the submission of the Emissions Report.</p>
3.108	<p>What are the available sources of information for a State when conducting the order of magnitude check?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.4.1.5.</i></p> <p>According to Annex 16, Volume IV, a State will perform an order of magnitude check of the Emissions Report of the aeroplane operator. Guidance for the State to conduct the order of magnitude check is included in the form of a checklist in the <i>Environmental Technical Manual (Doc 9501), Volume IV – Procedures for demonstrating compliance with the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA), Volume IV, in Table 3-9.</i></p>
3.109	<p>Why do both the aeroplane operator and verification body submit Emission Report and Verification Report to the State?</p>
	<p><i>Reference in Annex 16, Volume IV: Part II, Chapter 2, 2.4.1.4.</i></p> <p>Following the verification of the Emissions Report by the verification body, the aeroplane operator and the verification body shall both independently submit, upon authorization by the aeroplane operator, a copy of the Emissions Report and associated Verification Report to the State.</p> <p>Receiving both reports independently from the operator and verification body provides assurances to the State that the information contained in the reports has been agreed by both stakeholders. The State will then perform an order of magnitude check on the basis of these two reports submitted to the State.</p>
3.110	<p>Does ICAO provide training on CORSIA verification requirements?</p>
	<p>Yes. ICAO has launched a CORSIA Verification Course aimed to provide training on how to verify CO₂ Emissions Reports that have been prepared by aeroplane operators, in accordance with the provisions of the CORSIA SARPs. More information about the course, as well as upcoming deliveries can be found from the course webpage.</p>
4.	<p>Questions about CORSIA Implementation Elements</p>
	<p>CORSIA States for Chapter 3 State Pairs</p>
4.1	<p>What are “Chapter 3 State Pairs”?</p>
	<p>If a State participates in CORSIA offsetting, then all routes between this State and all other States participating in CORSIA offsetting are covered by offsetting requirements (see also questions 2.7 and 2.8). For a given year (starting in 2021), the States included in ICAO document entitled “CORSIA States for Chapter 3 State Pairs” define the State pairs subject to CO₂ offsetting requirements in CORSIA in that year.</p> <p>The ICAO document entitled “CORSIA States for Chapter 3 State Pairs” is directly referenced in Annex 16, Volume IV, Chapter 3, and will be available on the ICAO CORSIA webpage.</p>
4.2	<p>When will the first edition of ICAO document “CORSIA States for Chapter 3 State</p>

	Pairs” become available?
	According to Annex 16, Volume IV, States shall notify ICAO of their voluntary participation to CORSIA offsetting by 30 June 2020. The first edition of this ICAO document will become available, following approval by the ICAO Council, as soon as practicable, but no later than on 1 August 2020. This first edition will define the State pairs with CO ₂ offsetting requirements in CORSIA in 2021. This ICAO document will be annually updated in order to define the State pairs with CO ₂ offsetting requirements under CORSIA in subsequent years after 2021.
4.3	Where can the ICAO document “CORSIA States for Chapter 3 State Pairs” be found?
	Once available, the document will be made available on ICAO CORSIA webpage .
	ICAO CORSIA CO₂ Estimation and Reporting Tool (CERT)
4.4	What is ICAO CORSIA CERT?
	The ICAO CORSIA CERT is a simplified tool, which is developed for aeroplane operators to support the monitoring and reporting of their CO ₂ emissions under CORSIA (please also see questions 3.40 and 3.42).
4.5	What are the different versions of the ICAO CORSIA CERT?
	The ICAO CORSIA CERT will have different versions over time. The 2018 version of the ICAO CORSIA CERT allows operators to estimate their CO ₂ emissions from international flights and assess their eligibility or not of using the ICAO CORSIA CERT as a simplified monitoring method (see question 3.40).
	2019 version of the ICAO CORSIA CERT includes a functionality to not only estimate CO ₂ emissions, but also to generate aeroplane operator’s annual Emissions Report. Regarding the estimation of the CO ₂ emissions, the 2019 version of the tool allows either estimating CO ₂ emissions based on either Great Circle Distance, or on Block Time input.
	From 2021 onwards, the ICAO CORSIA CERT will be updated by including a list of States Pairs subject to CORSIA offsetting requirement for each year.
4.6	What is new in the 2019 version of the ICAO CORSIA CERT?
	Compared to the 2018 version, 2019 version of the ICAO CORSIA CERT includes the functionality to generate aeroplane operator’s annual Emissions Report. Also, regarding estimating the CO ₂ emissions, the 2019 version includes a functionality to estimate emissions by using a Block Time input.
4.7	Can an Emissions Report that was generated by the ICAO CORSIA CERT be submitted from an aeroplane operator to the State?
	The CORSIA Emissions Report template has been embedded into the ICAO CORSIA CERT, and the report generated by the tool can be submitted to the State Authority after third party verification.
4.8	Can the ICAO CORSIA CERT be used for an aeroplane operator’s internal pre-verification?
	In order to prepare for third-party verification, aeroplane operators are recommended to conduct a voluntary internal pre-verification in order to ensure that there will be no large data issues during the verification (also see question 3.81). ICAO CORSIA CERT can support an operator to cross-check CO ₂ emissions information during an internal pre-verification.
4.9	Will the third-party verification of an Emissions Report be cheaper when an aeroplane operator has used the ICAO CORSIA CERT for monitoring?
	External third-party verification is still required, also when an aeroplane operator has used ICAO CORSIA CERT for estimating its CO ₂ emissions. Details of the verification (including the price of the verification service) will be agreed and included

	in the contract between an aeroplane operator and a verification body (see also questions 3.84 and 3.89).
4.10	Where can one find more information about the ICAO CORSIA CERT?
	The ICAO CORSIA CERT, technical details on the design, development and validation of the tool, CORSIA CO ₂ Estimation Models, template for importing data into the ICAO CORSIA CERT, as well as a tutorial and separate FAQs and on the tool, can be found on ICAO CORSIA webpage .
	CORSIA Eligible Fuels
4.11	What is the definition of “CORSIA Eligible Fuels“?
	Annex 16, Volume IV provides the following definitions in this respect: <ul style="list-style-type: none"> • CORSIA Eligible Fuel: “A CORSIA sustainable aviation fuel or a CORSIA lower carbon aviation fuel, which an operator may use to reduce their offsetting requirements.” • CORSIA sustainable aviation fuel: “A renewable or waste-derived aviation fuel that meets the CORSIA Sustainability Criteria under this Volume.” • CORSIA lower carbon aviation fuel: “A fossil-based aviation fuel that meets the CORSIA Sustainability Criteria under this Volume.”
4.12	Which sustainability criteria shall be met by CORSIA Eligible Fuels?
	For an aeroplane operator to claim emissions reductions from the use of CORSIA Eligible Fuels, such fuel shall meet the CORSIA Sustainability Criteria defined within the ICAO document entitled “CORSIA Sustainability Criteria for CORSIA Eligible Fuels”. The criteria applicable during the CORSIA Pilot Phase (years 2021 - 2023) are available on the ICAO CORSIA website .
4.13	Which life cycle emissions values will be used for calculating the emissions reductions from CORSIA Eligible Fuels?
	The emissions reductions from the use of CORSIA Eligible Fuels in a given year are based on their life cycle emission values, which depend on the feedstock, conversion process, and region where the fuel was produced. There are two possibilities to obtain the life cycle emission value of a given CORSIA Eligible Fuel: An aeroplane operator can use a “default life cycle emissions value” from the ICAO Document entitled “CORSIA Default Life Cycle Emissions Values for CORSIA Eligible Fuels” that will be available on the ICAO CORSIA website ; or: An operator can use an “actual life cycle emissions value”, based on the methodologies defined in the ICAO document entitled “CORSIA Methodology for Calculating Actual Life Cycle Emissions Values”, which will be available on the ICAO CORSIA website . In this case, an approved Sustainability Certification Scheme shall ensure that the methodology has been applied correctly.
4.14	What constitutes the life cycle emission value of a CORSIA Eligible Fuel?
	The life-cycle emissions values of a CORSIA Eligible Fuel is composed of two main elements: 1) Core Life Cycle Assessment (LCA) emissions, which include the emissions associated with: feedstock cultivation, feedstock harvesting, collection and recovery, feedstock processing and extraction, feedstock transportation to processing and fuel production facilities, feedstock to fuel conversion processes, fuel transportation and distribution, and fuel combustion in an aircraft engine, and 2) Induced land-use change (ILUC) emissions – CORSIA Eligible Fuel production

	<p>may require some additional land to be used, and generate land use change GHG emissions. These could occur where the new CORSIA Eligible Fuel production is taking place (direct land use change) but also in other locations due to the displacement of crops (or animals) for which the land was previously used (indirect land use change). ILUC emissions assessment accounts for these different effects, by evaluating greenhouse gas released from conversion of natural vegetation (forest, other natural land), soil organic carbon, oxidation of peatlands, and sequestered biomass.</p> <p>The total life cycle emission value (LSf) value for a given CORSIA Eligible Fuel is the sum of core LCA emission and the ILUC emission.</p>
4.15	Who certifies CORSIA Eligible Fuel in order to be used in CORSIA?
	An aeroplane operator that intends to claim for emissions reductions from the use of CORSIA Eligible Fuels shall only use CORSIA Eligible Fuels from fuel producers that are certified by an approved Sustainability Certification Scheme.
4.16	What are the requirements for Sustainability Certification Schemes?
	Sustainability Certification Schemes must meet the requirements included in the ICAO document entitled “CORSIA Eligibility Framework and Requirements for Sustainability Certification Schemes”, which will be available on the ICAO CORSIA website once approved by the ICAO Council.
4.17	Where can one find a list of approved Sustainability Certification Schemes?
	Approved Sustainability Certification Schemes will be included in the ICAO document entitled “CORSIA Approved Sustainability Certification Schemes”, which will be available on the ICAO CORSIA website once approved by the ICAO Council.
4.18	Can an aeroplane operator claim all the CORSIA Eligible Fuel it has purchased?
	<p>No. An aeroplane operator cannot claim the amount of CORSIA Eligible Fuels that have been sold to a third party or claimed under another greenhouse gas emissions scheme.</p> <p>The aeroplane operator is required to provide a declaration of all other Greenhouse Gas schemes it participates in where the emissions reductions from the use of CORSIA Eligible Fuels may be claimed, and a declaration that it has not made claims for the same batches of CORSIA Eligible Fuel under these other schemes.</p>
4.19	Which date is relevant in order to claim a batch of CORSIA Eligible Fuel?
	The blending date of the CORSIA Eligible Fuel is relevant. An aeroplane operator can only claim a reduction to its offsetting requirements from the use of such fuel if it was blended during the associated compliance period. An aeroplane operator may therefore purchase a batch of CORSIA Eligible Fuel at an earlier date and make the claim in a later compliance period during which the blending occurs.
	CORSIA Eligible Emissions Units
4.20	What are emissions units, in general?
	<p>CORSIA calls for international aviation to offset part of its CO₂ emissions through the reduction of emissions elsewhere (outside of the international aviation sector), involving the concept of "emissions units". One emissions unit represents one tonne of CO₂ emissions reduced.</p> <p>Emissions units are generated when emissions from a specific project or programme are reduced, compared to a baseline (or business-as-usual), through the implementation of emission reductions techniques/technologies. These projects or programmes can be implemented in various sectors, such as electricity generation, industrial processes, agriculture, forestry, waste management etc. Emissions units are sometimes also referred to as carbon credits.</p>
4.21	What are the eligible emissions units to be used under CORSIA?

	The CORSIA Eligible Emissions Units are only those units described in the ICAO document entitled “CORSIA Eligible Emissions Units”, which meet the CORSIA Emissions Unit Eligibility Criteria contained in the ICAO document entitled “CORSIA Emissions Unit Eligibility Criteria” (see question 4.22). These ICAO documents will be available on the ICAO CORSIA website , once finalized and approved by the ICAO Council.
4.22	What are the eligibility criteria for CORSIA Eligible Emissions Units?
	The eligibility criteria for CORSIA Eligible Emissions Units has been approved by the ICAO Council, and is included in the ICAO document entitled "CORSIA Emissions Unit Eligibility Criteria", available on the ICAO CORSIA website .
4.23	Can an aeroplane operator already start purchasing CORSIA Eligible Emissions Units?
	An aeroplane operator can purchase emissions units at any time. However, aeroplane operators should be aware that they can use <u>only eligible emissions units</u> for the purpose of meeting their offsetting requirements under CORSIA. Paragraph 20 d) of the Assembly Resolution A39-3 requests the ICAO Council to establish, with the technical contribution of CAEP, a Technical Advisory Body (TAB) to make recommendations to the Council on the eligible emissions units for use by the CORSIA (see also question 4.27). In this regard, it is important to note that it is not the individual aeroplane operator or individual State who will determine which programmes and emission units are eligible in CORSIA, but the ICAO Council. Once determined by the Council, the CORSIA Eligible Emissions Units will be included in the ICAO document entitled "CORSIA Eligible Emissions Units".
4.24	Can an aeroplane operator implement a project that generates CORSIA Eligible Emissions Units?
	Yes – an aeroplane operator can implement emissions reduction project that generates emissions units. Equally to any other emissions unit, the emissions units generated from such a project need to meet the CORSIA Emissions Unit Eligibility Criteria, if the operator wishes to use the units to fulfill its offsetting requirements under CORSIA. It should be noted, however, that projects that reduce emissions from international flights would not be eligible to be used under CORSIA as this would result in double counting of emissions reductions.
4.25	Can an aeroplane operator cancel CORSIA eligible emissions units prior to having received the total final offsetting requirements from the State at the end of a compliance cycle?
	Yes. An aeroplane operator can purchase and cancel CORSIA eligible emissions units at any time, and does not need to wait until the operator has been notified of its total final offsetting requirements at the end of the compliance period.
4.26	What happens if an operator does not cancel enough CORSIA Eligible Emissions Units to meet its offsetting requirements?
	The State is required to take necessary action to ensure that the necessary national policies and regulatory framework be established for the compliance and enforcement of CORSIA (see also question 3.10).
4.27	What is the “Technical Advisory Body” (TAB)?
	Assembly Resolution A39-3 requested the ICAO Council, with the technical contribution of the ICAO Committee on Aviation Environmental Protection (CAEP), to establish a Technical Advisory Body (TAB) which will make recommendations to the Council on eligible emissions units for use by the CORSIA. The Council, at its 215th Session in November 2018, agreed to initiate a process to

	<p>establish the TAB. Following this agreement by the Council, a State letter was issued to ICAO’s Member States, inviting them to nominate experts to the TAB.</p> <p>At the 216th session in March 2019, the Council reviewed the nominated candidates to the TAB, and approved the TAB membership. At the same session, the Council also approved the TAB Terms of Reference (TOR).</p>
4.28	<p>What are the tasks of the TAB? Who are the TAB members?</p> <p>In line with the Assembly Resolution A39-3 request, the mandate of the TAB is to make recommendations to the Council on the eligible emissions units for use by the CORSIA.</p> <p>TAB Terms of Reference (TOR), as well as a list of TAB members, is available on ICAO CORSIA webpage.</p>
4.29	<p>What is the timeline for the work of the TAB?</p> <p>TAB Work Programme and Timeline are available on ICAO CORSIA webpage.</p>
4.30	<p>How will the TAB adjust to changing contexts, such as decisions at the UNFCCC?</p> <p>The iterative nature of the TAB process means that new information can be considered during a subsequent TAB assessment. The first TAB assessment will take place during 2019-2020. Further TAB assessments are anticipated. Thus, the TAB’s work will continue to consider new information, new programmes, and new decisions which may affect the eligibility of emissions units for use under the CORSIA.</p>
4.31	<p>Where can one find more information about the TAB?</p> <p>More information on TAB can be found from the ICAO CORSIA webpage.</p>
	<p>CORSIA Central Registry (CCR)</p>
4.32	<p>What is the CORSIA Central Registry (CCR)?</p> <p>The CCR is one of the five implementation elements of CORSIA. It is an information management system that will allow States to submit CORSIA-related data and information to ICAO in a standardized format. Using the CCR, the ICAO Secretariat will store the submitted information, perform calculations, develop the necessary reports for CORSIA, and make available the required information for transparency (see question 4.40 for the information to be made publically available through the CCR).</p>
4.33	<p>When will the CCR become available?</p> <p>The development of the CCR began in March 2019. The first version of the CCR will become operational by early 2020 (see question 3.60 for the timelines for reporting).</p>
4.34	<p>How does the reporting from a State to ICAO work before the CCR becomes operational (e.g., submission of list of aeroplane operators attributed to a State)?</p> <p>The ICAO Secretariat has developed an online spreadsheet to facilitate the communication (e.g., on the aeroplane operators attributed to the State, and on the verification bodies accredited in the State) between a State and ICAO for the time period before the CCR becomes fully operational. More information on this has been communicated to the CORSIA Focal Points of Member States.</p>
4.35	<p>If an aeroplane operator is in a parent-subsidary relationship, does the State need to list the subsidiary operator on the CCR?</p> <p>Information submitted by States will be used to facilitate the compilation and publication of the ICAO document “CORSIA Aeroplane Operator to State Attributions”, which aims to avoid duplications and gaps in attributing aeroplane operators to States, and to promote the highest level of completeness in terms of the aeroplane operators participating in CORSIA. For the purposes of reporting aeroplane operators to ICAO, a State should include both the subsidiary and the parent aeroplane operator into the list, and report information (attribution method, identifier, contact information) separately for each operator.</p>

	<p>For other purposes of CORSIA (e.g., for reporting of CO₂ emissions and emissions unit cancellations), and assuming that the State has approved it, the two operators can be treated as a single consolidated aeroplane operator (see also question 3.14).</p>
4.36	<p>Should the list of aeroplane operators include operators which do not have any requirements under CORSIA?</p> <p>If an aeroplane operator does not have CORSIA requirements, there is no need for the administering State of that operator to include it in the list of operators for the purposes of CORSIA. However, if the operator is close to the threshold of annual CO₂ emissions (10 000 tonnes of CO₂), it should engage with the State to which it is attributed for further guidance. Likewise, the State should maintain oversight of the operators attributed to it, and engage with any of them that may be close to or above the threshold (see also question 3.22).</p> <p>A State can include an operator, which is close to the annual threshold for CO₂ emissions, or which is likely to exceed the threshold in the future, into the list of operators, if the State so decides (see question 4.35 for the purpose of the list of operators).</p>
4.37	<p>How can a State validate information contained in the list of verification bodies accredited in the State?</p> <p>As set out in Appendix 1 of Annex 16, Volume IV, States are required on an annual basis (by 30 November) to submit updates to ICAO on the list of verification bodies accredited in the State, in accordance with Annex 16, Volume IV, Part II, Chapter 1, 1.3.7. The State may also submit updates to this list to ICAO on a more frequent basis.</p> <p><u>What is an update?</u></p> <p>Updating the State list of verification bodies in the CORSIA Central Registry (CCR) can include adding newly accredited verification bodies, and changing the status of verification bodies already in the list. For example, a verification body could choose to voluntarily withdraw from the CORSIA accreditation, or it could have its accreditation withdrawn by the national accreditation body (NAB). In this case, the State would mark the status of the verification body in the CCR as “inactive”. Indicative information about verification bodies that are in the process of accreditation should not be included in the State list of verification bodies in the CCR.</p> <p>Only verification bodies that have an “active” status in a State list in the CCR will be included in the submission to ICAO.</p> <p><u>Identifying updates to the list of verification bodies accredited in the State</u></p> <p>Different States will have a different level of interaction with their national accreditation body (ies). States that are working closely with their NABs may have the option to ask them to provide regular updates on the status of the accreditation of their verification bodies. For States without this option, it is recommended that compilation of the list begins at least two months in advance of the ICAO submission deadline. As a first step in compiling the list of verification bodies accredited within the State, the State should search the website of those NAB(s) that offer a CORSIA verification body accreditation programme for an online list of verification bodies that have been accredited. NABs in many States publish such lists either online or in hard copy, and include information about the scope of the accreditation, accreditation status, and contact details for the accredited verification body. Using the published list, the State</p>

should determine if there have been any new accreditations since the last ICAO list update, and if the status of any verification bodies already in the State list has changed (if applicable). If such a published list of accredited verification bodies is not readily available, the State should reach out directly to the NAB(s) for information about any new accreditations since the last update, and if the status of any verification bodies already in the State list has changed.

Validating updated information

If there are any updates, the State should seek supporting information about each affected verification body from the NAB. Types of information that should be sought, including directly from the NAB where the information is not publicly available, are set out in Table 1 below. Once compiled, the State should conduct a review of the information for accuracy. Recommended items that should be checked by the State are also included in Table 1.

After the State and the NAB confirm the status of each verification body in question, the State should encourage the NAB to update any of its own public lists of CORSIA verification bodies (e.g. website).

Even where all required information is available publically, it is recommended that the State confirm the information with the NAB before submitting to ICAO.

Table 1: Types of information to be requested by a State from the national accreditation body

	Information to request from NAB	What to check	Rationale/Other comments
1	Name of verification body	<ul style="list-style-type: none"> Confirm that the name of the verification body matches the name on the accreditation certificate or other official documentation 	
2	Specific verification body locations that are accredited (if applicable)	<ul style="list-style-type: none"> Confirm that the specific verification body locations provided match the locations specified on the certificate or other official documentation 	Some verification bodies have multiple offices, including international operations. The scope of the accreditation may not be applicable to all locations.
3	The title of the specific CORSIA accreditation and scope of accreditation	<ul style="list-style-type: none"> Confirm that the accreditation listed is specific to CORSIA, including accreditation to ISO 14065:2013 and the CORSIA requirements set out in Annex 16, Volume IV Confirm the accreditation scope matches the official documentation (e.g. for Emissions Reports and/or Emissions Unit Cancellation Reports) 	Verification bodies that do not meet the full set of requirements for either verifying the Emissions Report and/or the Emissions Unit Cancellation Report according to Annex 16, Volume IV cannot be considered CORSIA verification bodies and should therefore not be included in the ICAO list.
4	The date that the verification body received its accreditation, and/or the date its accreditation changed	<ul style="list-style-type: none"> Confirm that the date provided matches the official documentation Confirm that this date is not in the future 	

	5	The date when the accreditation expires, or until when the status change is valid	<ul style="list-style-type: none"> • Confirm that the date provided matches the official documentation • For verification bodies already on the list, confirm that the accreditation has not already expired 	
	6	The status of the accreditation: pending, conditional, accredited, withdrawn, suspended etc.	<ul style="list-style-type: none"> • For new verification bodies to be added to the list, confirm that the status is CORSIA accreditation, and that the accreditation is not pending or conditional in any way • Confirm the accreditation status of verification bodies already on the list 	NABs globally may use different terms and offer differing types of accreditation status. It is important for the State to understand what each of the different status are.
	7	A copy of the accreditation certificate of each accredited verification body: this could include a link to the online certificate, if available	<ul style="list-style-type: none"> • Use this to confirm the information about each accredited verification body provided by the NAB 	
	8	Any other documentation that the State needs to understand the accreditation status of each verification body	<ul style="list-style-type: none"> • Use this to confirm the information about each accredited verification body provided by the NAB 	
4.38	What is the information that a State submits to ICAO in relation to accredited verification bodies?			
	<p>Once the necessary elements are confirmed, the State should compile the complete list of verification bodies accredited in the State at the time of submission to ICAO. As per Annex 16, Volume IV, Appendix 5, Table A5-3 this compilation must include the following:</p> <ul style="list-style-type: none"> • State; and • Name of verification body. <p>The State should <u>not</u> include in its list to ICAO those verification bodies that are in the process of accreditation, or are not accredited to CORSIA requirements, as specified in Annex 16, Volume IV. In addition, those verification bodies that have lost their accreditation should be marked as “inactive”.</p> <p>For newly accredited verification bodies, States are also encouraged to submit the following information to ICAO:</p> <ul style="list-style-type: none"> • The accreditation certificate (or online web link to the certificate). <p>The State list of accredited verification bodies that have an “active” status should then be submitted to ICAO through the CCR by the submission deadline.</p>			
4.39	Will the lists of aeroplane operators and accredited verification bodies be updated on a regular basis?			
	<p>States are required to provide ICAO with updates to the lists of aeroplane operators and accredited verification bodies annually by 30 November. State may also submit updates to this information to ICAO on a more frequent basis. ICAO will update the ICAO documents “CORSIA Aeroplane Operator to State Attributions”, and “CORSIA Central Registry (CCR): Information and Data for Transparency” as needed, and once new information is being reported from States.</p>			
4.40	What levels of information will be available to the public from the CCR?			

Information and data relating to CORSIA that has been reported by States to ICAO through the CORSIA Central Registry (CCR) will be published on the ICAO website as five ICAO CORSIA documents. All ICAO CORSIA documents will be published following their approval by the ICAO Council.

The ICAO document “*CORSIA Central Registry (CCR): Information and Data for the Implementation of CORSIA*” is an umbrella document that provides information to support implementation of CORSIA. It includes the following ICAO documents:

- “*CORSIA Aeroplane Operator to State Attributions*”
- “*CORSIA 2020 Emissions*”
- “*CORSIA Annual Sector’s Growth Factor (SGF)*”

The following information will be made available in the ICAO document entitled “*CORSIA Central Registry (CCR): Information and Data for Transparency*”

- List of verification bodies accredited in each State;
- Total average CO₂ emissions for 2019 and 2020 aggregated for all aeroplane operators on each State pair;
- Total annual CO₂ emissions aggregated for all aeroplane operators on each State pair, with identification of State pairs subject to offsetting requirements; and
- For each aeroplane operator:
 - Aeroplane operator name;
 - State in which aeroplane operator is attributed;
 - Reporting year;
 - Total annual CO₂ emissions;
 - Total annual CO₂ emissions for State pairs subject to offsetting requirements;
 - Total annual CO₂ emissions for State pairs not subject to offsetting requirements;
- For CORSIA Eligible Fuels claimed:
 - Production year;
 - Producer of the fuel;
 - Type of fuel, feedstock and conversion process used;
 - Batch number(s);
 - Total mass of each batch;
 - State reporting the information;
- Information at a State and global aggregate level for a specific compliance period:
 - Total final offsetting requirements over the compliance period;
 - Total quantity of emissions units cancelled over the compliance period to reconcile the total final offsetting requirements; and
 - Consolidated identifying information for cancelled emissions units, including:
 - Quantity of emissions units cancelled;
 - Start and end of serial numbers, and date of cancellation;
 - Eligible emissions unit program;
 - Unit type, Host country, Methodology;
 - Demonstration of unit date eligibility;
 - Program-designated registry name.

4.41 What happens to the data flagged as confidential by the State when CCR receives it?

Data that are flagged as confidential by States will be treated as such by ICAO. This

	<p>information will be used for calculations (for example, to determine the Sector's Growth Factor) but will not be published in any ICAO CORSIA document (see question 4.40).</p> <p>All data flagged as confidential will be aggregated and published by ICAO without attribution to a specific aeroplane operator or specific State pair.</p>
4.42	<p>How will the reporting of emissions units cancellations from State to CCR work?</p>
	<p>Similar to the reporting of CO₂ emissions, States will report aggregated information to ICAO through the CCR. This information will include:</p> <ul style="list-style-type: none"> • Aeroplane operators attributed to the State; • Compliance period years reported; • Total final offsetting requirements; • Total quantity of emissions units cancelled; and • Consolidated identifying information for cancelled emissions units, including: <ul style="list-style-type: none"> ○ Quantity of emissions units cancelled; ○ Start and end of serial numbers, and date of cancellation; ○ Eligible emissions unit program; ○ Unit type, Host country, Methodology; ○ Demonstration of unit date eligibility; ○ Program-designated registry name. <p>The complete list of information to be reported from aeroplane operators to States, and from States to ICAO is included in Annex 16, Volume IV Appendix 5. Also, see question 4.40 for information that will be made available to the public from the CCR.</p>

5.	Questions about the cost impact of CORSIA																																
5.1	What is the estimated quantity to be offset under the CORSIA?																																
	<p>Since the 38th ICAO Assembly, CAEP provided a significant amount of technical analyses regarding the impacts of different approaches for a global MBM scheme' design, as requested by the Council. The analyses included quantification of the total quantities of CO₂ emissions from international aviation based on the CAEP CO₂ trends assessment, and estimation of the total quantities of offsets.</p> <p>Based on the CAEP analyses presented to the CAEP/11 meeting in February 2019, the total offsetting requirements resulting from CORSIA are estimated to be approximately 2.5 billion tonnes of CO₂ from 2021 to 2035. The figure below illustrates the estimated total annual offsetting requirements.</p> <table border="1"> <caption>Estimated total annual offsetting requirements (in tCO₂) Millions</caption> <thead> <tr> <th>Year</th> <th>Offsetting Requirements (in tCO₂) Millions</th> </tr> </thead> <tbody> <tr><td>2021</td><td>21</td></tr> <tr><td>2022</td><td>35</td></tr> <tr><td>2023</td><td>48</td></tr> <tr><td>2024</td><td>60</td></tr> <tr><td>2025</td><td>72</td></tr> <tr><td>2026</td><td>84</td></tr> <tr><td>2027</td><td>160</td></tr> <tr><td>2028</td><td>180</td></tr> <tr><td>2029</td><td>201</td></tr> <tr><td>2030</td><td>221</td></tr> <tr><td>2031</td><td>242</td></tr> <tr><td>2032</td><td>263</td></tr> <tr><td>2033</td><td>286</td></tr> <tr><td>2034</td><td>309</td></tr> <tr><td>2035</td><td>333</td></tr> </tbody> </table>	Year	Offsetting Requirements (in tCO ₂) Millions	2021	21	2022	35	2023	48	2024	60	2025	72	2026	84	2027	160	2028	180	2029	201	2030	221	2031	242	2032	263	2033	286	2034	309	2035	333
Year	Offsetting Requirements (in tCO ₂) Millions																																
2021	21

2034	309																																
2035	333																																
5.2	What is the estimated compliance cost for the CORSIA offsetting requirements by aeroplane operators?																																
	<p>CAEP also analyzed possible costs of CORSIA by multiplying the estimated quantities of offsets with the assumed emissions unit prices. It should be noted that the emissions unit prices drive difference in total cost impacts of offsetting CO₂ emissions from international aviation.</p> <p>Considering carbon prices ranging from the low assumption of 6 to 12 \$/ton CO₂-eq to the high assumption of 20 to 40 \$/ton CO₂-eq, the estimated costs from CORSIA offsetting are presented in the table below.</p>																																

Carbon Price Assumptions:

<u>IEA High</u>	20 \$/ton	33 \$/ton	40 \$/ton
<u>IEA Low</u>	8 \$/ton	15 \$/ton	20 \$/ton
<u>Alternative Low*</u>	6 \$/ton	10 \$/ton	12 \$/ton

Putting the costs into a business perspective, the analysis also shows that the cost of carbon offsetting for operators could range from approximately 0.4% to 1.4% of total ICAO forecast revenues from international aviation in 2035 (source: A39-WP/153).

According to a cost analysis conducted by IATA, the offsetting costs related to the implementation of a global MBM scheme are expected to have a much lower impact on international aviation than that caused by fuel price volatility. The estimated offsetting cost in 2030 is equivalent to that of a 2.6 US\$ rise in jet fuel price per barrel. This means that an extra 10 US\$ per barrel on the price of jet fuel would cost the industry about four times the estimated cost of offsets in 2030. To give a reference on magnitude, over the past decade the standard deviation of the jet fuel price annually has been almost 40 US\$ per barrel, meaning that airlines have managed to cope with oil price volatility (mostly upwards) of more than 15 times the size of the estimated offsetting cost in 2030.

5.3 What is the estimated administrative cost for the CORSIA implementation by States, aeroplane operators and ICAO?

According to the CAEP analysis, the vast majority (i.e., 98%) of the total cost resulting from the CORSIA is comprised of costs from offsetting requirements (see [question 4.2](#) for estimated cost of CORSIA offsetting requirements). These costs represent a small fraction of total operating costs or revenue from international aviation.

According to CAEP’s analysis, cost for the implementation of the MRV system and Registry are borne by aeroplane operators, ICAO Member States and ICAO, and represent approximately 1.4%; 0.5%; and 0.02% of total cost from the CORSIA respectively.

6. Questions about capacity building and assistance for CORSIA implementation

6.1 What is ICAO “ACT-CORSIA”?

The ICAO Assistance, Capacity building and Trainning programme on CORSIA (ACT-CORSIA) is aimed at supporting Member States to implement CORSIA’s monitoring, reporting and verification (MRV) requirements as per Annex 16, Volume IV.

ACT-CORSIA, which was officially launched during the ICAO Seminar on CORSIA

	<p>(Montréal, Canada, 2-3 July 2018), responds to ICAO Council’s endorsement of the Secretariat plan for the CORSIA-related outreach and capacity building activities under ICAO coordinated approach.</p> <p>It is designed to harmonize and bring together all relevant actions, promoting coherence to CORSIA capacity building efforts, and includes a number of activities and products, namely: CORSIA buddy partnerships; model regulations; frequently asked questions (FAQs); brochures and leaflets; videos; seminars and related materials; online tutorials; and other background information.</p> <p>All information on ACT-CORSIA is accessible through the ICAO CORSIA website.</p>
6.2	<p>What are the activities covered under the ICAO ACT-CORSIA?</p> <p>ICAO ACT-CORSIA includes a number of activities and products, namely: CORSIA buddy partnerships; example regulatory framework; frequently asked questions (FAQs); brochures and leaflets; videos; seminars and related materials; online tutorials; and other background information.</p>
6.3	<p>What are CORSIA Buddy Partnerships?</p> <p>CORSIA Buddy Partnerships are a cornerstone of ICAO’s plan to support States to prepare for CORSIA implementation. Under the partnerships, technical experts provided by donor States are working together with the CORSIA focal points of recipient States to provide on-site training, and to closely follow-up on the preparation and implementation of the recipient States’ CORSIA MRV system, in close coordination with the ICAO Secretariat.</p>
6.4	<p>How many CORSIA Buddy Partnerships have been established under the ICAO ACT-CORSIA programme?</p> <p>As of June 2019, a total of 15 donor States are providing support to more than 95 recipient States under the ACT-CORSIA Buddy Partnerships.</p> <p>The most up-to-date information on established partnerships is available on the ICAO CORSIA webpage.</p>
6.5	<p>What is ICAO’s plan for continued capacity building for CORSIA implementation?</p> <p>Recognizing the need for continuous capacity-building in implementing CORSIA, the contents of the ACT-CORSIA Buddy Partnerships will be adjusted in accordance with the implementation phases of CORSIA.</p> <p>Whereas the first phase from 2018 onwards focuses on the development and approval of the Emissions Monitoring Plans as well as on the development of the national/regional regulatory frameworks, it is foreseen that the second phase of ACT-CORSIA Buddy Partnerships in 2019-2020 will focus on reporting and verification aspects of CORSIA implementation; and that the third phase will provide assistance on the aspects related to CORSIA Eligible Emissions Units and CORSIA Eligible Fuels.</p> <p>The second phase of the partnerships was launched at the ICAO Environmental Symposium in May 2019, and the donor States, together with the recipient States, are commencing the training activities for the second phase during the second half of 2019, in close coordination with the ICAO Secretariat.</p>
6.6	<p>How can my State contribute to ICAO ACT-CORSIA?</p> <p>All ICAO States are encouraged to inform the ICAO Secretariat of their assistance needs, as well as of their offers to support other States. States in a position to do so are encouraged to contribute additional resources through voluntary funding and/or other in-kind contributions to ICAO ACT-CORSIA.</p>
6.7	<p>What is ICAO doing to ensure the availability of verification bodies at the time when</p>

	aeroplane operators will be required to have their Emissions Reports verified?
	ICAO has launched a CORSIA Verification Training Course, which provides information on how to verify CO ₂ Emissions Reports (also see question 3.110).
