SOUTH AFRICAN CIVIL AVIATION AUTHORITY

AGENDA ITEM 9.1.5
ITU WRC-15

Presented by Koos Pretorius,
SACAA

Regional Frequency Spectrum Workshop for ITU WRC-15

Pattaya, Thailand
March 11-12, 2014

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

WRC-15 Agenda Item 9.1

5 (9.1.5);

Consideration of technical and regulatory actions in order to support existing and future operation of fixed-satellite service earth stations within the band 3 400 – 4 200 MHz, as an aid to the safe operation of aircraft and reliable distribution of Meteorological information in some countries in Region 1 (Resolution 154 (WRC-12))

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

Historic Background

Aviation safety across the African Continent has been compromised by a lack of reliable fixed aeronautical telecommunications infrastructure used for providing Air Traffic Services/Direct Speech (“ATS/DS”) and Aeronautical Fixed Telecommunications Network (“AFTN”) voice and data services

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

Historic Background Continue

African Service Providers, **Air Traffic and Navigation Services** (ATNS) and the **Agency for the Safety of Aerial Navigation in Africa** (ASECNA) introduced Very Small Aperture Terminal (VSAT) networks to resolve the lack of communications.

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

Historic Background Continue

The basic networks evolved as improved technology became available and today sports the ATNS SADC/2 network supporting the Southern African Development Community (SADC), the North East AFI (Africa-Indian Ocean) Region, to address the ATS/DS and AFTN deficiencies within this region. (The NAFISAT network)

Historic Background Continue

In West Africa a network was also initiated by ASECNA.
This network called AEROSATEL was implemented to provide Reliable Aeronautical Fixed and mobile services in the West and Central Africa region in the ACCRA, KANO, N`DJAMENA and NIAMEY FIR.

Historic Background Continue

This initial network was expanded and became AFISNET.
This service covers the ASECNA area including Roberts FIR, Madagascar, Reunion and Mayotte, The Comoros, Angola, Algeria, Sao Tome & Principe with links to South Africa and France

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

Historic Background Continue

Additional Multi-Channel per Carrier (“MCPC”) point-to-point links are provided in the SADC and NAFISAT VSAT network for interconnection to the ASECNA **AFISNET** (“Africa Indian Ocean Satellite Network”) VSAT network operated in West Africa.

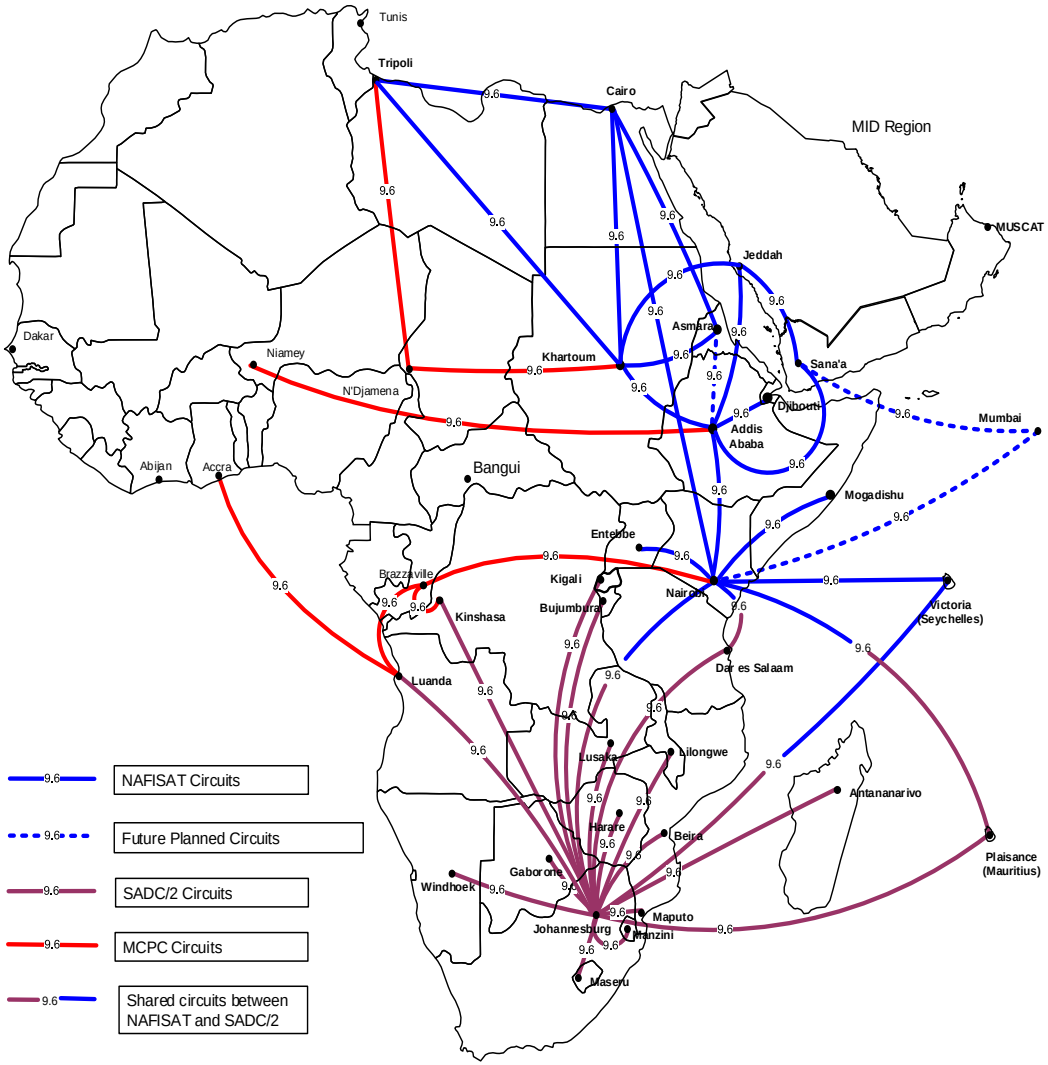
SOUTH AFRICAN CIVIL AVIATION AUTHORITY

The CAFSAT (Central Atlantic Firs VSAT) Network

The CAFSAT network links the SAM, EUR and AFI regions and provides interconnectivity between the AFI networks and the South American digital network (REDDIG)

ATNS VSAT NETWORK
NAFISAT and SADC/2 - AFTN Connectivity

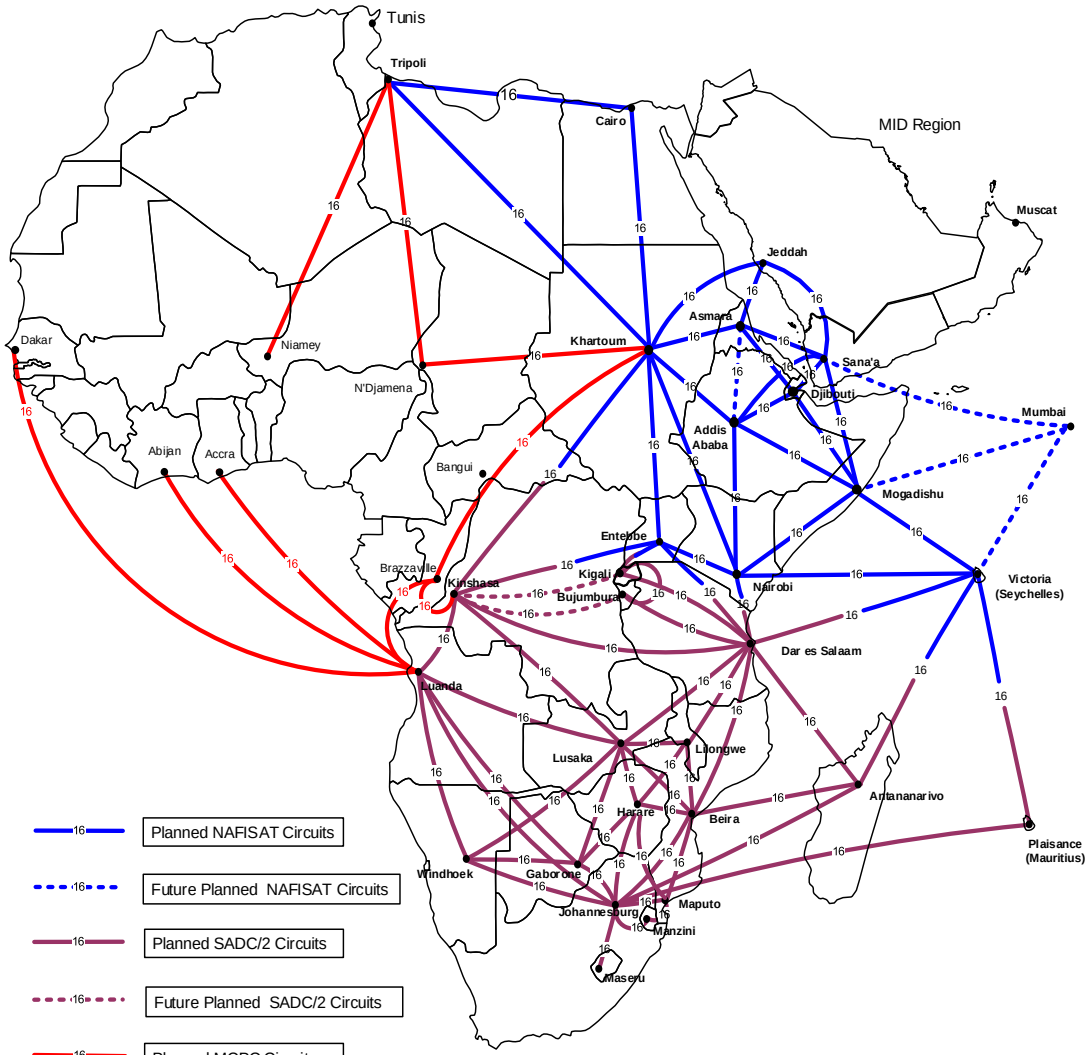
SOUTH AFRICAN CIVIL AVIATION AUTHORITY



Revision 4.0 1-07-2013

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

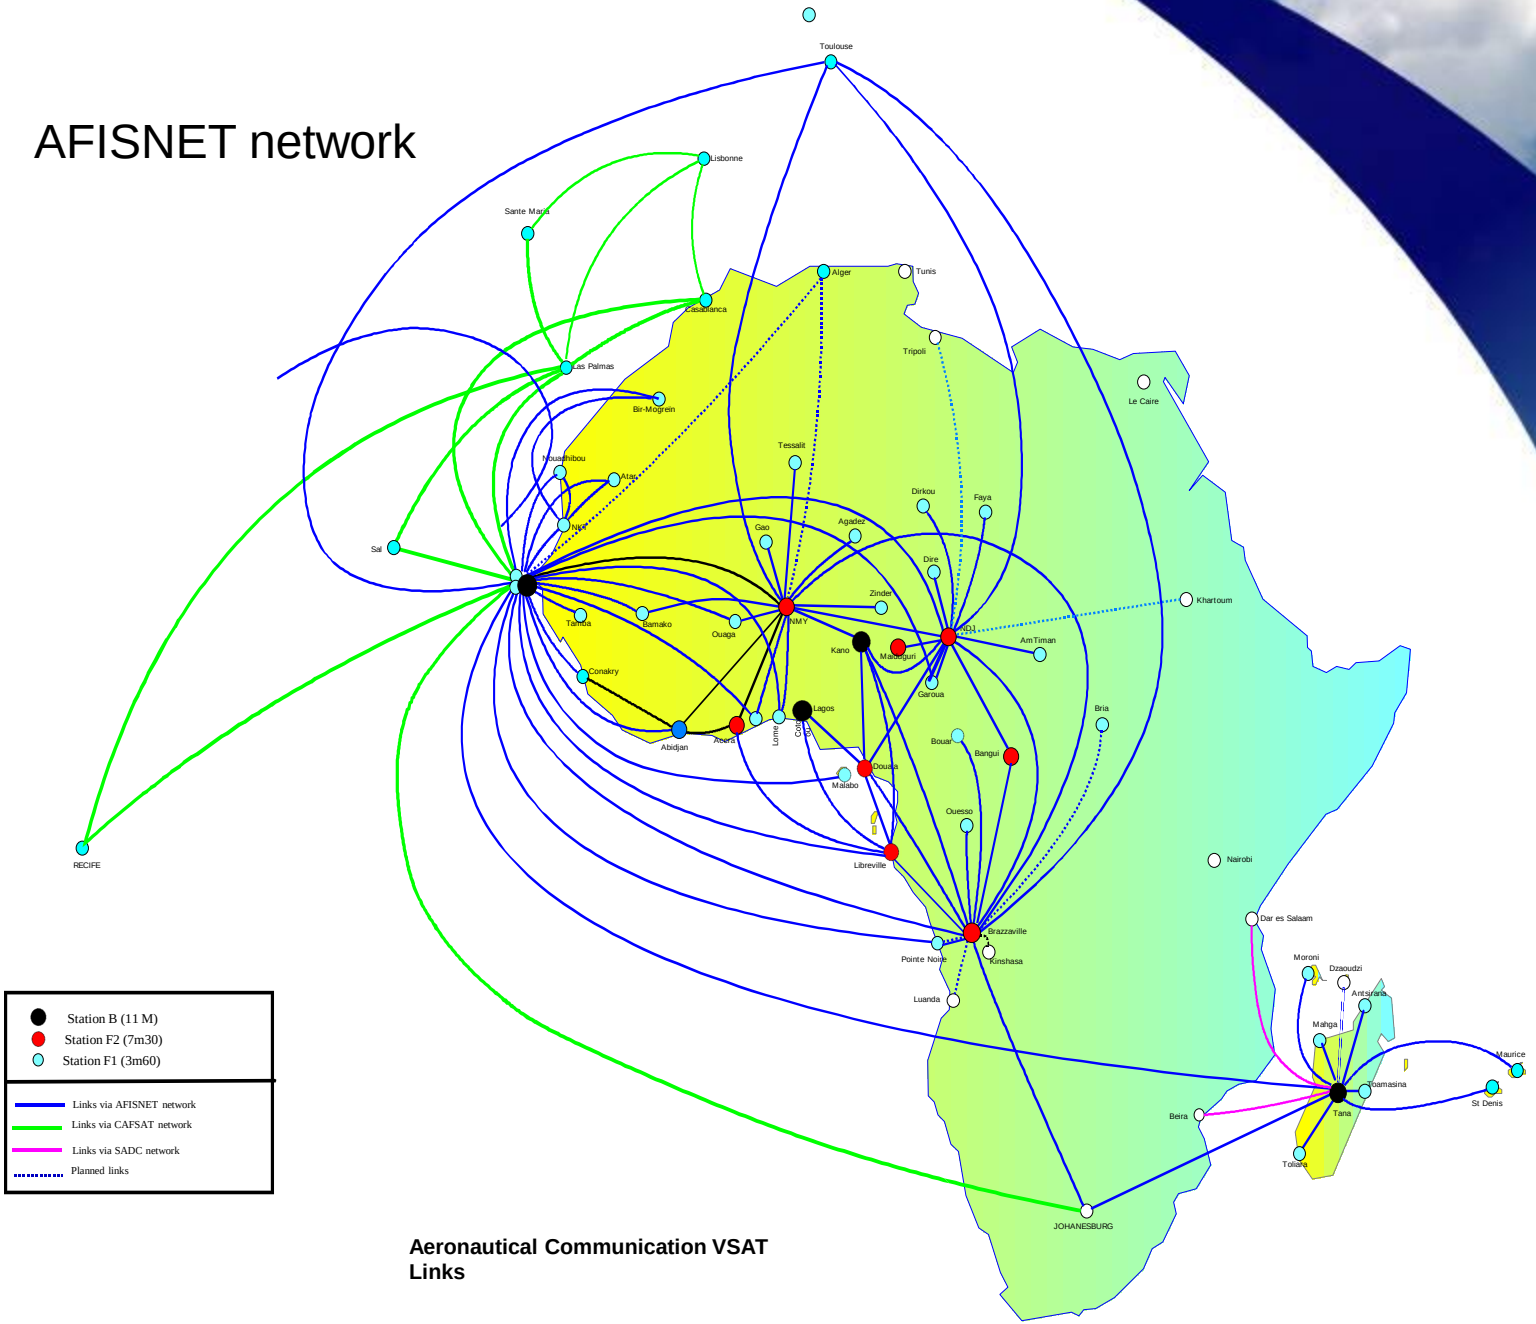
ATNS VSAT NETWORK:
NAFISAT and SADC/2 - ATS/DS Connectivity



Revision 2.0 1-07-2013

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

AFISNET network



Aeronautical Communication VSAT Links

Historic Background Continue

These VSAT networks support all aeronautical communications services including the extension of VHF aeronautical mobile, navigation and surveillance.

VSAT networks are also used for data links for the meteorological services in Africa

Historic Background Continue

Today, VSAT networks constitute a real infrastructure, spanning the entire African continent and beyond. The availability of the entire 3.4 to 4.2 GHz FSS band is crucial for the AFI Region to ensure the continued growth of traffic while maintaining the required level of safety in this region.

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

Agenda Item 1.4 at the World Radio Conference of 2007 (WRC-07), addressed the issue whether the band 3400 MHz to 4200 MHz (“C-band”) should be identified for the International Mobile Telecommunications (IMT) on a global basis with the longstanding primary allocation to the fixed satellite service (FSS)

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

WRC-07 rejected the global identification for IMT in the C-band because of the recognised need to protect FSS communications from harmful interference evidenced in studies by the ITU

Historic Background Continue

WRC-07, subject to certain restrictions, adopted new footnotes to Radio Regulations to allow the band 3400MHz to 3600MHz for use by the IMT, but only by countries listed in the foot notes (opt-in countries).
The restrictions established additional protection for the C-band earth stations by the opt-in countries in each of the three ITU regions.

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

Historic Background Continue

81 Countries in Region 1 opt-in and the band 3400- 3600MHz was allocated and became effective in November 2010 on a co-primary basis for the mobile (including IMT) with PFD limit restrictions and coordination requirements

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

Historic Background Continue

In the 14 opt-in countries in Region 2, the 3400 MHz – 3500 MHz band was allocated by footnote to mobile services (which includes IMT) on a co-primary basis subject to coordination with affected administrations

The 3500 MHz – 3600 MHz band has also been identified for IMT in opt-in countries in Region 3.

*Since the effective date, interference interruptions have occurred throughout Africa, and in Australia, Bolivia, Peru, the Caribbean, China, Fiji, Hong Kong, Indonesia and Russia.

**Source - Squire, Sanders & Dempsey L.L.P.*

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

IMT INTERFERENCE

The main culprit of interference to aeronautical VSAT networks is **WiMAX** (**Worldwide Interoperability for Microwave Access**)

Tests indicated that interference was not caused by co-channel Assignments, but by the harmonic content in the side lobes of the radiated signal

RE: Complaint on C-Band Frequency Allocation to WiMax and Broadband Wireless Access Service Provider:

We acknwlege receipt of your letter dated 30 October 2006 regarding the above subject matter.

We regret to learn that your client ABC has been experiencing interference on their VSAT services.

Following to your complaint our engineers along with your Telecommunications engineer visited ABC offices where the VSAT is installed. It was confirmed that there was indeed interference caused by Vodacom Wimax operations. However, this interference was not caused by double allocation but rather by WiMax harmonics which spread over C-Band affecting weak VSAT receive signals. Please note that vodacom were assigned frequency band (3434-3449.5) MHz uplink and (3534-3549.5) MHz downlink Where as ABC VSAT operates on 3705.50 MHz for receive and 5930.850 MHz for transmit.

We understand that Vodacom have switched off their WiMax equipment as a temporary solution to this problem however TCRA is currently working very hard in finding the best possible way to resolve this problem permanently.

Thank you for your patience and continued cooperation

Your Sincerly,

James Kilaba
FOR: DIRECTOR GENERAL.

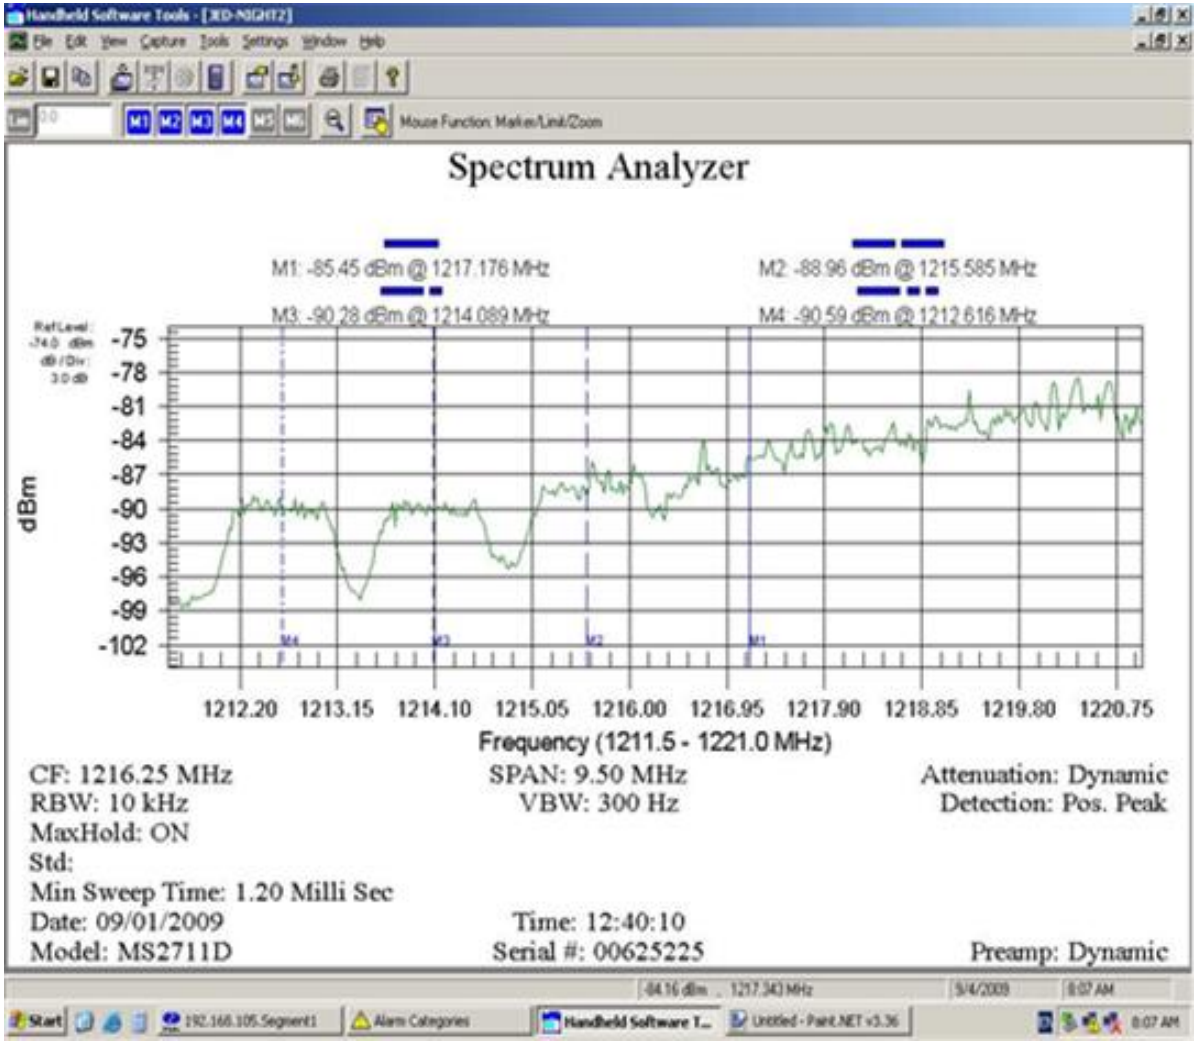
Instance of Interference recorded



Plot of Interference found on the VSAT carriers (NAFISAT network)

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

Instance of Interference recorded/continued…

- Interference was neither present during installation of the VSAT terminal nor during subsequent preventative maintenance visits
- The fault that developed on the particular terminal is caused by local interference as all the VSAT terminals connected to this VSAT are operational
- It was concluded that local WiMAX transmissions could be the most likely source of the interference
- It was decided to change the home channel of the terminal to a channel with less interference

Resolving the interference

Different methods used to resolve interference

- Changing the channels
- Using Filters
- Relocating antennae
- Shielding antennae

CONCLUSION

- Regulatory measures are needed to ensure an appropriate level of protection for the FSS C-band spectrum which is used to augment terrestrial communication networks through the use of VSAT technology. VSAT technology is used to facilitate safety of life CNS services within the aeronautical community.
- Long-term VSAT spectrum availability and protection from interference should be guaranteed across the entire African Continent and other parts of the world. The meeting is invited to support the following recommendation:

SOUTH AFRICAN CIVIL AVIATION AUTHORITY

Recommendation – Long-term very small aperture terminal spectrum availability and protection:

a) that ICAO Member States should not support additional International Mobile Telecommunications spectrum allocation in the fixed satellite services C-band spectrum at the expense of the current or future aeronautical very small aperture terminal networks; and

b) ICAO and ICAO Member States to pursue this matter in ITU-R and during the World Radio Conference (WRC-15, Agenda Items 1.1 and 9.1.5), to prevent any international mobile telecommunications spectrum allocation that compromises the availability of the aeronautical very small aperture terminal networks

Thank You
?
