

ICAO UNITING AVIATION

Operation of Aircraft Workshop

Becoming Risk-Based

Zewdu Aregawi

Regional Officer, Safety Implementation

ESAF

Oct. 2021

Discussion points

1. Familiarity with regulatory provisions
2. Prioritizing surveillance activities
3. Safety Risk profile
4. iSTARS Risk-based surveillance application
5. Safety Information Monitoring System

ICAO UNITING AVIATION

Operation of Aircraft Workshop

1. Familiarity with regulatory provisions

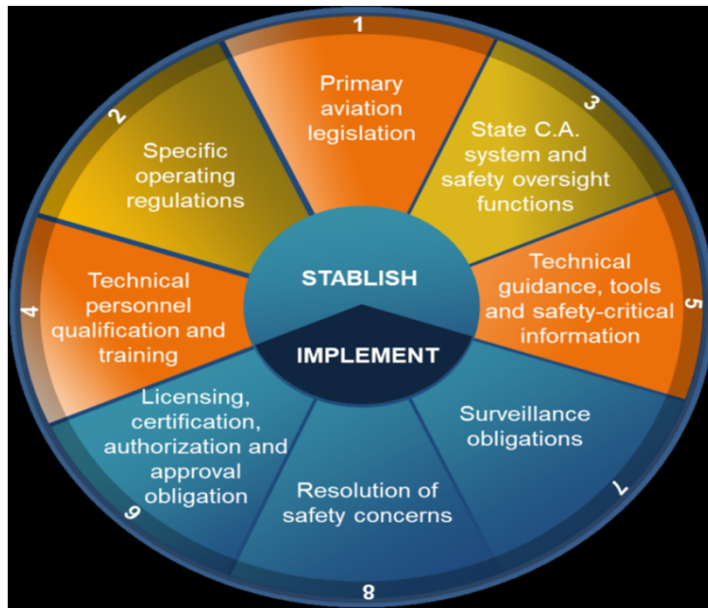

Annex 19 - Applicability

- Annex 19 requires States to establish and maintain an SSP that is commensurate with the size and complexity of the State's civil aviation system.
- As part of implementing SSP, States shall require that the following service providers to implement an SMS:
 1. **Approved training organizations in accordance with Annex 1 that are exposed to safety risks related to aircraft operations during the provision of their services;;**
 2. **Operators of aeroplanes or helicopters** authorized to conduct international **commercial air transport**;
 3. **Approved maintenance organizations** providing services to Operators of aeroplanes or helicopters authorized to conduct international commercial air transport;
 4. Organizations responsible for the **type design** or **manufacture** of aircraft, engines and propellers in accordance with Annex 8; ;
 5. **Air traffic services (ATS) providers** in accordance with Annex 11 and;
 6. **Operators of certified aerodromes** in accordance with Annex 14, Volume I .
- State shall also require international general aviation operators of large or turbojet aeroplanes to implement SMS.

Safety oversight vs Surveillance

Safety Oversight: A function performed by a State to ensure that individuals and organizations performing an aviation activity comply with safety-related national laws and regulations.

Safety oversight vs Surveillance

Surveillance: The State activities through which the State proactively verifies through inspections and audits that aviation license, certificate, authorization or approval holders continue to meet the established requirements and function at the level of competency and safety required by the State.

Surveillance obligation

ANNEX 19

3.4.1.2 Recommendation. States should establish procedures to prioritize inspections, audits and surveys towards those areas of greater safety concern or need.

DOC. 9859

A SRBS approach enables prioritization and allocation of a State's safety management resources commensurate with the safety risk profile of each sector or individual service provider.

DOC. 8335

Inspections should also be planned on the basis of a risk assessment exercise so that aspects of the operation that involve the greatest risk should receive more frequent attention.

ICAO

UNITING AVIATION

2. Prioritizing surveillance activities

ICAO UNITING AVIATION

Operation of Aircraft Workshop

Prioritizing Surveillance Activities

- Does your State have UNLIMITED resources that can be assigned to surveillance activities?

Prioritizing Surveillance Activities

- If you answered no, then:
- you need a means to prioritize...
...and make the best use of your limited resources

ICAO UNITING AVIATION

Operation of Aircraft Workshop

Prioritizing Surveillance Activities

How do you prioritize your surveillance activities

Prioritizing Surveillance Activities

- A safety risk-based surveillance (SRBS) approach enables prioritization and allocation of State's safety management resources commensurate with the safety risk profile of each sector or individual service provider.
- States gain experience and familiarity with each service provider by monitoring the steadily developing maturity of their safety assurance process, and in particular, their management of safety performance.
- The State may choose to amend the scope and/or frequency of surveillance as their confidence and evidence of the service provider's safety capability develops.

Prioritizing Surveillance Activities (cont'd)

- The foundation of effective SRBS is reliable enough and meaningful data. Without reliable and meaningful data, it is difficult to defend adjustments to the surveillance scope or frequency.
- States should develop or reinforce their data management capabilities to ensure they have reliable and comprehensive data upon which to base their (data-driven) decisions.

Prioritizing Surveillance Activities (cont'd)

- Safety risk-based surveillance may not necessarily reduce the amount of surveillance conducted or the resources, however, the quality of the surveillance and the quality of the interaction between the regulator and the service provider will improve greatly.

3. Safety risk profile

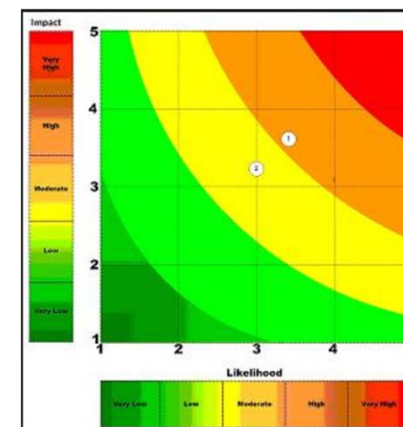

Develop risk profiles

Service provider organizational safety risk profiles

States may wish to develop organizational safety risk profiles using information that may already be available for service providers including:

- a) the financial health of the organization;
- b) number of years in operation;
- c) turnover rate of the key personnel such as the accountable executive and safety manager;
- d) competence and performance of the accountable executive;
- e) competence and performance of the safety manager;
- f) results of previous audits;
- g) timely and effective resolution of previous findings;
- h) measures of relative level of activity (exposure to safety risk);
- i) indicators of the relative scope and complexity of the activities being performed;
- j) maturity of the hazard identification and safety risk assessment process; and
- k) measures of safety performance from State safety data analysis and performance monitoring activities.

4. iSTARS risk-based surveillance app

iSTARS risk-based surveillance app

- is one of the application in the iSTARS
- It allows building risk-based/Data-driven inspection schedules for operations
- By choosing an operator and filling out a questionnaire based on areas such as safety management and flight ops the following can be calculated:
 - safety performance level
 - operational complexity level
 - surveillance intensity level
 - risk-based inspection schedule

Risk-based surveillance planning

Risk Based Surveillance

+

=

Annual Flights	4000 to 45000 *
Aircraft	17 or more *
Aircraft Models	2 to 4
Destinations	11 to 50
Is International	Yes *
Average Fleet Age	Less than 5 years

iSTARS risk-based surveillance app

Schedule

The schedule is defining a sample size for each inspection type based on the actual number of elements to be inspected.

	Aircraft	Stations	Check Pilots
Population Size	26-50 *	26-50 *	2-8 *

The sample size is defined using the ISO sampling model. The base inspection is unique and its period only depends on the intensity.

Activity Type	Related Population	Minimum Activities	Periodicity
Route Inspection - Cabin	Stations	8	2 months
Route Inspection - Flight Deck	Stations	8	2 months
Ramp Inspections	Aircraft	8	2 months
Station Inspections	Stations	8	2 months
Check Pilot Inspections	Check Pilots	2	6 months
Base inspection	-	1	18 months

5.Safety Information Monitoring System

- Safety Information Monitoring System (SIMS) is an ICAO web-based information system comprised of different applications, which generates indicators in support of State Safety Programme (SSP) and Safety Management System.
- It is a platform for States to exchange and share safety data and information.
- Currently SIMS contains six applications such as Ramp Inspections Applications, Airspace Monitoring Applications (Horizontal Flight Efficiency), Approach Monitoring Applications (Vertical Flight Efficiency), Occurrences Application, Runway Safety Application and . ADS-B Coverage Application.

ICAO

UNITING AVIATION

Operation of Aircraft Workshop

BEHIND

Ramp inspection application

- The ramp inspections sharing application allows for ICAO Member States participating in SIMS to monitor and share foreign air operator surveillance (ramp inspection) data on this secured platform with each other and within their respective Regional Aviation Safety Groups (RASGs) in support of Safety Management.
- States will be able to prioritize their ramp inspections and monitor their air operators' compliance by checking the number of inspections and seriousness of findings per inspection in two different capacities, either as State of operator or as State of inspection.
