Climate Research

The importance of CO₂ – a scientific reminder

Earth System Research Laboratories

Center for International Climate Research

A scientific reminder of the metrics used

• 'Radiative Forcing' (RF, in watts per square metre) is used to quantify present-day impacts from current and (largely) historical emissions (in the case of long-lived greenhouse gases) as it has an approximately linear relationship with the equilibrium global mean surface temperature change $(\Delta T_s \text{ in Kelvin})$ since the onset of industrialization

$$\Delta T_s = \lambda RF$$

- Where λ is the climate sensitivity parameter in K (Wm^-2)^-1
- Since IPCC AR5, the scientific community is now using the 'Effective Radiative Forcing' (ERF), since it accounts for fast feedbacks from e.g. clouds, aerosols better and has a better relationship with ΔT_s

Climate Research

Aviation is more than CO₂

- The non-CO₂ impacts are ~65% of the present-day *Effective Radiative Forcing* from historical and current emissions
- They have larger uncertainties than CO₂ but
- Non-CO₂ impacts remain important

Slide 7

International aviation CO₂ emissions

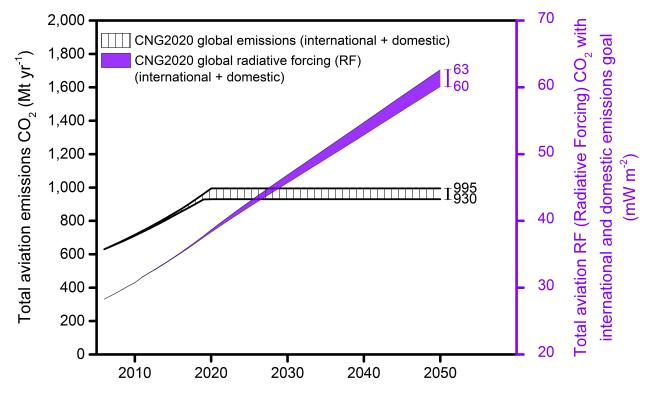

°CICERO

Climate Research

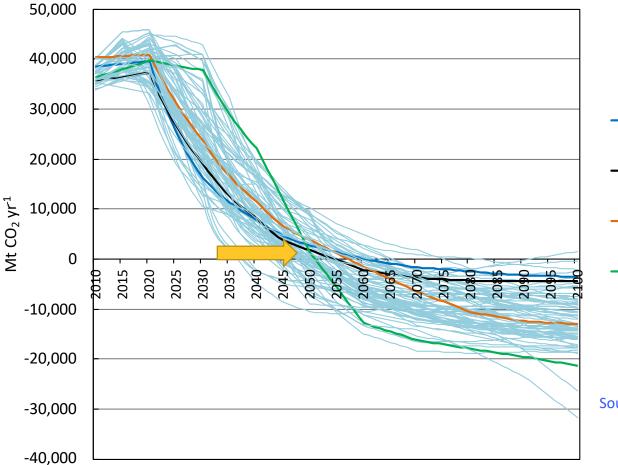

Why CO_2 is so difficult –scenario applying CNG2020 emissions of aviation CO_2

If the emissions stop increasing (stay constant in this case), the concentrations of CO_2 in the atmosphere continue to accumulate, and therefore the RF (and temperature response) continue to increase

IPCC 1.5 degrees CO₂ emission data

Continued aviation CO_2 emissions to 2050 will be inconsistent with 1.5 degree emission

Ongoing and potential future mitigation measures

Measures

CORSIA

CO₂ Airplane Standard

Operational improvements

Lower C footprint biofuels

Carbon neutral synthetic fuels

- CO₂ Change in non-CO₂
 - ×

1

- ✓ (if fuel \downarrow ; small \downarrow NO_x, if ≈ EI), potentially small \uparrow in contrails
- ✓ (if fuel \downarrow ; small \downarrow NO_x, if \approx EI)

 ✓ reduced aromatics, S in fuel: decreased contrails, decreased direct negative RF from S aerosol, unknown changes in aerosol – cloud interactions.

Center for International Climate Research

Summary

- Achieving CNG2020 for international aviation CO₂ emissions will still result in a continued <u>increase</u> in RF (and temperature contribution)
- Aviation has additional non-CO₂ emissions, adding to the sector's RF and temperature contribution
- To meet Paris Agreement goals (Article 2a, 4) and net zero emissions by 2050*, continued CO₂ emissions from international aviation are problematic

* IPCC SR1.5 SPM C1 "In model pathways with no or limited overshoot of 1.5°C, global net anthropogenic CO₂ emissions decline by about 45% from 2010 levels by 2030 (40–60% interquartile range), reaching net zero around 2050 (2045–2055 interquartile range)" Slide 11
