Total traffic: history and forecasts	23

METHODOLOGY

1. BACKGROUND

1.1 With a view to responding to the needs of States, regional air navigation planning groups and environmental planning bodies, several sets of long-term traffic forecasts were developed under the auspices of ICAO over the past decade. In considering this development and the resulting complexities, Resolution A38-14 requested the Council to “develop one single set of long-term traffic forecasts, from which customized or more detailed forecasts can be produced for various purposes, such as safety, air navigation systems planning and environmental analysis”.

1.2 The Multi-disciplinary Working Group on Long-term Traffic Forecasts (MDWG-LTF) under the Aviation Data and Analysis Panel (ADAP) was tasked to develop a single set of long-term traffic forecasts. The MDWG-LTF comprised of ten Member States and three international organizations. The membership of MDWG-LTF also included five members of the Committee of Aviation Environmental Protection (CAEP) working groups. The work of the group has resulted in the replacement of ICAO's decade-old simple forecasting techniques with more rigorous econometric models.

2. DATA AND MODEL SPECIFICATION FOR PASSENGER AND CARGO FORECAST

2.1 A time-series data set of Revenue Passenger Kilometres (RPK) and Freight Tonne Kilometres (FTK) was created for both international and domestic operations at city pair and carrier levels from 1995 to 2012 by compiling:

- a) actual traffic data reported by States to ICAO (through the Air Transport Reporting Forms A, B and C) and published directly by States, the coverage of which was over 90 per cent of air passenger traffic and 95 per cent of freight traffic; and
- b) estimated traffic data based on the airline schedules published in the Official Airline Guide (OAG), which was used to fill the gaps.

2.2 This initial data set was subsequently reconciled with operations data in the Common Operations Database (COD) maintained by the CAEP in order to establish common baseline traffic volumes for the year 2012.

2.3 While the previous passenger traffic forecasts made in 2013 by the CAEP consisted of 32 route groups, the MDWG-LTF decided to segment passenger forecasts into a total of 50 route groups (40 international and 10 domestic, Appendix refers). In order to obtain the flexibility of having different elasticity estimates based on income level and market maturity, these 50 route groups were assigned to six different tiers based on the World Bank definitions of low, lower-middle, upper-middle and high-income economies (<http://data.worldbank.org/about/country-and-lending-groups>)¹. Concerning freight forecasts, since nearly 80 per cent of the traffic moves in the East-West trade lane, it was decided to use six regions instead of the 50 route groups.

2.4 The specification of the appropriate dynamic demand equations followed economic theories and a “general to specific” approach that starts with a model which is over parameterised² and then simplifies to a more specific form on the basis of statistical tests and the overall explanatory power of the model. After a series of diagnostic tests, the equation selected to predict annual change in passenger traffic for each route group is a function of real GDP per capita and cost of travel:

$$\Delta \log \widehat{RPK} p_{c_{rt}} = \sum_{i=1, j=1}^6 \beta_i (T_j * \Delta \log GDP p_{c_{rt}}) + \beta_{oil} \Delta \log Cost of Travel_{rt} + dummies$$

i: tier coefficient index, j: tier index, t: year, r: route group, pc: per capita, Δ: difference between t and t-1

¹ The 6 tiers are: T1 = both origin and destination are low-income economies; T2 = origin is low-income economies and destination is either lower-middle or upper-middle income economies or vice versa; T3 = origin is high-income economies and destination is low income economies or vice versa; T4 = origin is high-income economies and destination is either lower-middle or upper-middle income economies or vice versa; T5 = both origin and destination are either lower-middle or upper-middle income economies; and T6 = both origin and destination are high-income economies.

² Explanatory variables considered and tested include gross domestic product (GDP), income, population, travel cost, international trade volumes and employment.

2.5 As there is no coherent methodology to obtain specific airfare costs, oil prices were used as a proxy for cost of air travel, consistent with recent literature on this topic. In addition, dummy variables are added to the model to take into account the effect of “special” events such as those of September 11th 2001 and the Severe Acute Respiratory Syndrome (SARS) outbreak.

2.6 A panel data analysis using a first difference estimator (i.e. based on difference between year t and year t-1) was used to estimate the passenger traffic equation. This approach best fits the dataset and information available for estimation while allowing for controlling of both time series and cross-sectional aspects of the data.

2.7 Unlike the passenger demand model, the equation of the freight demand for most of the regions includes real GDP per capita as a sole explanatory variable because the estimated coefficients of oil prices were not statistically significant.

$$\widehat{\log FTK}_t = \alpha + \beta \log GDP_t \quad t: \text{year}$$

2.8 Individual ordinary least squares (OLS) regression was used for each region as it performed better than other approaches.

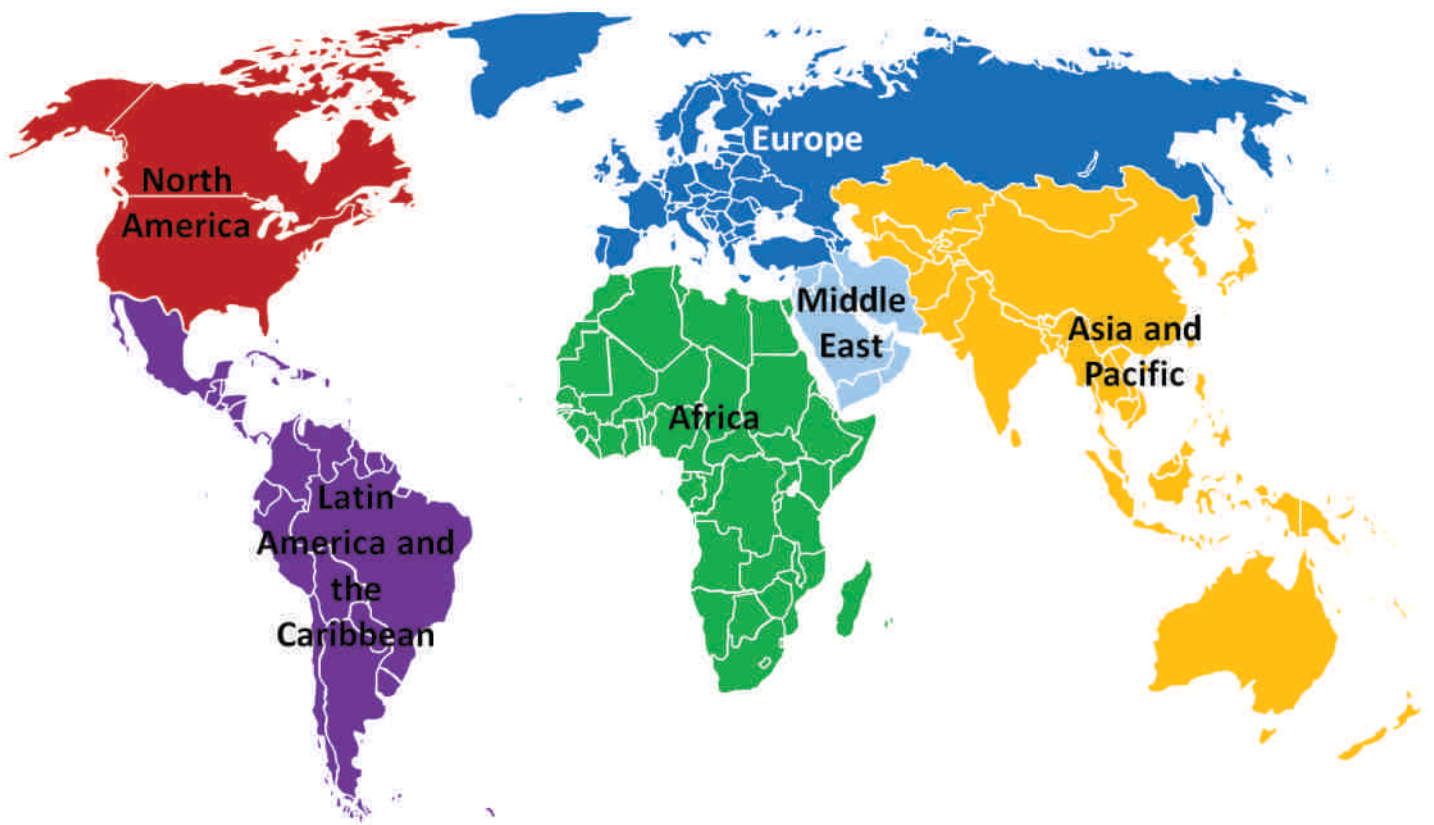

3. RESULTS OF ESTIMATION

3.1 The predicted changes in the RPKs and predicted annual FTKs are used to calculate Compound Annual Growth Rates (CAGR) of passenger and freight traffic for twenty (2012-2032) and thirty (2012-2042) year period. The estimated results are summarized in Appendix to this document.

3.2 The estimated results indicate that global passenger traffic will grow at 4.6 per cent annually to 2032. Fourteen route groups outpace the global growth, including all route groups involving Central Southwest Asia. The fastest growing route group is Domestic Central Southwest Asia, which is estimated to grow at around 10 per cent annually. The growth rates of route groups in and between Africa, Central America/Caribbean and Middle East are close to the global growth rate. Route groups in and between mature markets including Europe, North America, and North Asia have a lower estimate of growth rate.

3.3 Global freight traffic is expected to grow at 4.4 per cent annually over the same time period as passenger forecasts. The Middle East has the highest forecast of annual growth outpacing global estimate by about 2.8 percentage points. The growth rate of Asia/Pacific is close to the global estimate, at 4.7 per cent. Europe, Latin America/Caribbean, and North America will grow at a slightly slower pace than Asia/Pacific while Africa has the lowest annual growth rate of 2.1 per cent.
