

TECHNOLOGY – Propelling the Future of Aviation.

ICAO is a key player in the use of aviation intelligence and data analysis for the purpose of monitoring safety and operational efficiency performance. Because aviation is such a rich data environment, ICAO has organized a symposium that brings together all key organizations to address air navigation and safety-related issues associated with information and data gathering, applications and infrastructure.

This unique event will bring together for the first time, the Aviation and the Information Technology (IT) industries. Participants will include International aviation companies and associations, IT companies, data-houses, regulators, air operators, and air navigation service providers.

The objective of the symposium is to provide a forum for direct collaboration, discussion, technical demonstrations and information sharing, to address the aviation industry requirements for **data collection, management, analysis, mining and aviation intelligence.**

This international symposium will provide a first-hand opportunity to learn about emerging and potential technologies that can improve current capabilities. The event will feature keynote presentations on air navigation, safety and enabling technologies as well as sessions where companies can present projects, techniques, practical use cases and technologies.

ICAO is currently accepting submissions for presentations pertaining to aviation data-related technologies and intelligence via our website www.icao.int/meetings/IBC2014
